December, 2010

FOREWORD

The first Census of Agriculture (CA) in Uganda was conducted during the period of 1963/65 with the assistance of the Food and Agriculture Organisation of the United Nations (FAO) and the then Department of Technical Cooperation of Britain. The second Census of Agriculture (National Census of Agriculture and Livestock) was conducted during 1990/91 although preparatory arrangements had started earlier. That census was funded by the United Nations Development Programme (UNDP) and executed by FAO. The Ministry then responsible for agriculture was the implementing agency. The third and latest in the series is the Uganda Census of Agriculture (UCA) of 2008/09. Its main objective was to establish a system of Food and Agriculture Statistics (FAS), for providing timely information to inform policy and planning.

This report presents the findings relating to area, production, yields and disposition of major crops. In addition, the report presents agricultural holding characteristics such as the number of agricultural households, the number and location of parcels, the number of plots as well as the mean plot sizes for each crop, parcel ownership and average holding size. The information contained in this report is particularly useful to policy makers, researchers and traders for evidence based planning and the making of informed decisions.

The UCA 2008/09 was conducted as a joint effort between the Government of Uganda as the funding agency and the Uganda Bureau of Statistics (UBOS), in close collaboration with the Ministry of Agriculture, Animal Industry and Fisheries (MAAIF) were the implementing agencies. UBOS and MAAIF are extremely grateful to: FAO, the United Kingdom (UK) Department for International Development (DFID) and the Norwegian Agency for development (NORAD) for providing technical assistance.

Similar gratitude is extended to the national staff, comprised of the headquarter staff (from UBOS and MAAIF), District Supervisors (DSs), Enumerators and other support staff who, formed an effective team. Our gratitude also goes to the numerous farmers who provided the answers to the many questions as well as the District and Local Council (LC) officials who provided guidance to the Enumerators in the sampled areas in all the 80 districts of Uganda (as of July 2007) where the census was successfully conducted.

EXECUTIVE SUMMARY

Prior to the conducting of the Uganda Census of Agriculture (UCA), 2008/09 two (2) other censuses had been conducted. The first CA was conducted during 1963/65. The Government of Uganda was assisted by FAO and the then Department for Technical Cooperation of the United Kingdom both of which provided international and census equipment to a varying degree.

The second CA called the National Census of Agriculture and Livestock (NCAL) was conducted during 1990/91. It was funded by United Nations Development Programme (UNDP) and executed by FAO. Therefore the UCA 2008/09 formed the third CA in the history of census taking in Uganda.

The long-term objective of the UCA, 2008/09 was to have a system of Food and Agriculture Statistics (FAS) in place, the immediate objective was to collect and generate benchmark data needed for monitoring and evaluation of the agricultural sector at all levels, through a nation-wide CA.

The UCA 2008/09 was conducted during the Second Season of 2008 and First Season of 2009 and covered all the 80 districts as at July 2007.

This report therefore presents the findings relating to Area, Production, Yields and Disposition of major crops. In addition, the report presents agricultural holding characteristics such as Number of agricultural households, Number and location of parcels, Number of plots as well as Mean Plot Sizes for each crop, Parcel ownership and Average Holding Size.

Maize, Beans, Banana (Food), Cassava and Sweet Potatoes were the crops grown by most of the Ag HHs in the country, with each grown by over one million households in each of the two seasons. Of these five major crops, maize carried the day with over 1.5 million Ag HHs growing the crop in each season.

The national production of maize during the period under reference was 2.4 million Mt, which came from an estimated area of one (1) million hectare (Ha). There was no big difference in the quantity of production from both the second and first season; both seasons had about 1.2 million Mt. The national yield of Maize was estimated to be 2.3 Mt/Ha.

The estimated total number of plots under maize was 2.9 million with 1.4 million (47.1%) under pure stand while the national Mean Plot Size (MPS) was estimated to be 0.35 Ha.

The national production of Finger Millet during the UCA 2008/09 was estimated to be 277,000 Metric tons (Mt) from an area of 250,000 Hectares (Ha), with a higher percentage of this production (163,000 Mt or 58.9%) having been realised from the Second Season of 2008. It is worth noting that much as

there was an increase in area under the crop from 116,000 Ha to 134,000 Ha (16%) between the Second Season 2008 and the First Season of 2009, there was a decrease in production from 163,000 Mt to 114,000 Mt. The national yield of Finger Millet was estimated to be 1.1 Mt/Ha.

The total number of plots under Finger Millet was estimated to be 936,000 with 459,000 (49.0%) under pure stand while the national MPS was estimated to be 0.27 Ha.

The national production of Sorghum was estimated to be 376,000 Mt from an area of 399,000 Ha. The biggest percentage of this output (217,000 Mt or 57.9%) was produced in the Second Season 2008. The national yield of sorghum was estimated at 0.9 Mt/Ha.

The total number of plots under sorghum was estimated to be 1.2 million with 824,000 (68.0%) under pure stand while the national MPS was estimated to be 0.33 Ha.

The national production of rice during the UCA 2008/09 was estimated to be 191,000 Mt from an area of 75,000 Ha. The highest percentage of this production (136,000 Mt or 71.2%) was realised from Second Season of 2008. The national yield of rice was 2.5 Mt/Ha.

The estimated total number of plots under Rice was 187,000 with 152,000 (81.3%) under pure stand while the national MPS was estimated to be 0.40 Ha.

The national production of beans during the UCA 2008/09 was 929,000 Mt, from an estimated area of 618,000 Ha. The highest percentage of this production (546,000 Mt or 58.7%) was realised from Second Season of 2008. The national yield of beans was estimated to be 1.5 Mt/Ha.

The total number of plots under beans was estimated to be 2.3 million with 804,000 (35.3%) under pure stand whereas the national MPS was estimated to be 0.27 Ha.

The national production of Field Peas during the UCA 2008/09 was estimated to be 16,000 Mt from an area of 44,000 Ha. The highest percentage of this production (11,000 Mt or 70.0 %) was realised from Second Season of 2008. The national yield of Field Peas was estimated to be 0.4 Mt/Ha.

The total number of plots under Field Peas was estimated to be 132,000 with 95,000 (72.0%) under pure stand while the national MPS was estimated to be 0.33 Ha.

The national production of Cow Peas during the UCA 2008/09 was estimated to be 11,000 Mt from an area of 23,800 Ha. The highest percentage of this production (6,700 Mt or 60.7%) was realised from Second Season of 2008. The national yield of Cow Peas was estimated to be 0.5 Mt/Ha.

The estimated total number of plots under Cow Peas was 77,000 with 57,000 (74.7%) under pure stand while the MPS was estimated to be 0.31 Ha.

The national production of Pigeon Peas during the reference period was estimated to be 11,300 Mt from an area of 29,800 Hectares, with the bigger percentage of this production (6,094 Mt or 53.8%) having been realised from the second season of 2008. The national yield of Pigeon Peas was estimated to be 0.4 Mt/Ha. The total number of plots under Pigeon Peas was estimated to be 59,000 with 36,000 (60.9%) under pure stand while the national MPS was estimated to be 0.51 Ha.

The national production of groundnuts during the period under reference was estimated to be 245,000 Mt from an area of 345,000 Hectares (Ha), with a higher percentage of this production (155,000 Mt or 63.2%) having been realised from the Second Season of 2008. The national yield of groundnuts was estimated to be 0.7 Mt/Ha. The total number of plots under Groundnuts was estimated to be 1.4 million with 676,000 (47.9%) were of pure stand while the national MPS was estimated to be 0.24 Ha.

The national production of Simsim during the period under reference was 101,000 Mt from an area of 176,000 Ha, with the biggest percentage of this production (85,000 Mt or 83.7%) realised from the second season of 2008. The national yield of Simsim was estimated to be 0.6 Mt/Ha. The total number of plots under Simsim was estimated to be 467,000 with 319,000 (68.1%) under pure stand while the national MPS was estimated to be 0.38 Ha.

The national production of Soya Beans during the period under reference was estimated to be 23,000 Mt from an area of 36,000 Ha. There was no big difference in the quantity of production from both the second 2008 and first season 2009. The national yield of Soya beans was estimated to be 0.6 Mt/Ha. The total number of plots under Soya Beans was estimated to be 106,000 with these, 62,000 (58.2%) under pure stand while the national MPS was estimated to be 0.34 Ha.

The national production of Banana (Food type) during the period under reference was estimated to be 4 million Mt from a total area of 807,000 Ha, with the bigger percentage of this production (2.1 million Mt or 53.1%) realised in the Second season 2008. The national yield of Banana (Food type) was estimated to be 5.0 Mt/Ha. The total number of plots under Banana (Food) was estimated to be 2.9 million with 1.1 million (39.0%) under pure stand while the national Mean Plot Size (MPS) was estimated to be 0.28 Ha.

The national production of Banana (Beer) during the period under reference was 243,000 Mt, which came from an estimated area of one 86,000 (Ha). Each of the two seasons of the reference year contributed to about half of the total production realised. The national yield of Banana (Beer type) was estimated to be 2.8 Mt/Ha. The total number of plots under Banana (Beer Type) was estimated to be 208,000 with these, 114,000 (54.9%) under pure stand while the national MPS was estimated to be 0.41 Ha.

The national production of Banana (Sweet Type) during the period under reference was 37,000 Mt, which came from an estimated area of one 23,000 (Ha) with a higher percentage of this production (20,000 Mt or 55.3%) having been realised from the Second Season of 2008. The national yield of Banana (Sweet type) was estimated to be 1.6 Mt/Ha. The number of plots under Banana (Sweet Type) was estimated to be 76,000 with 39,000 (51.5%) under pure stand while the national MPS was estimated to be 0.31 Ha.

The national production of Cassava during the period under reference was 2.9 million Mt, which came from an estimated area of one 871,000 (Ha) with a higher percentage of this production (1.7 million Mt or 57.6%) having been realised from the Second Season of 2008. The national yield of Cassava was estimated to be 3.3 Mt/Ha. The number of plots under Cassava Plots was estimated to be 3.1 million with 1.9 million (61.2%) under pure stand while the national MPS was estimated to be 0.28 Ha.

The national production of Sweet Potatoes during the period under reference was 1.8 million Mt, which came from an estimated area of one 440,000 (Ha) with a higher percentage of this production (1.8 million Mt or 62.4%) having been realised from the Second Season of 2008. The national yield of Sweet Potatoes was estimated to be 4.1 Mt/Ha. The total number of plots under Sweet Potatoes was estimated to be 2.7 million with 2.3 million (83.4%) under pure stand while the national MPS was estimated to be 0.16 Ha.

The national production of Irish Potatoes during the period under reference was 154,000 Mt, which came from an estimated area of one 33,000 (Ha) with a higher percentage of this production (87,000 million Mt or 56.2%) having been realised from the Second Season of 2008. The national yield of Irish Potatoes was estimated to be 4.7 Mt/Ha. The total number of plots under Irish Potatoes was estimated to be 270,000 with 163,000 (60.3%) under pure stand while the national MPS was estimated to be 0.12 Ha

CHAPTER ONE

INTRODUCTION

1.1 Background

The Uganda Census of Agriculture (UCA) undertook to establish agricultural land (i.e. area of parcels and plots under crops, plots under fallow, farm houses, stables, others, etc) and all agricultural production in the Household arising from the measured area during the reference period. Not only was it meant to establish bench mark data for the National Statistical System but to reinforce efforts made by government in combating hunger and poverty hence achieving economic growth as one of the cornerstones of the MDGs (reflected in Goal 1).

Rural poverty is strongly related to the structure and efficiency of the agricultural production systems and above all Crop area, Production and profitability analysis of agricultural activities can help to understand the transition process from production for domestic/household consumption to commercialised agriculture and to draw conclusions for future development of the majority rural poor.

The UBOS initiated a number of preparatory activities for the UCA 2008/2009. Under the funding of the grant from the Royal Norwegian Government, an Agricultural Module (AM) was included in the PHC 2002; A Pilot Census of Agriculture (PCA) was carried out in 2003 and due to time lag, a further pre-test was conducted in May 2008.

The data generated from the PHC included; number of crop plots planted during the first agricultural season of 2002; type of crop stand; livestock and poultry numbers: (by local and exotic/improved breed) and information about fish farming. From the data generated, it became evident and paramount that area cover of crops for both mixed and pure plots be determined for the two main agricultural seasons in a year so as to be able to estimate the annual production by district and region of Uganda.

Reliable estimation of annual production of food crops and other agricultural commodities are very important, especially for a developing country such as Uganda which is making serious efforts to tackle the problem of feeding her population, diversifying her export crops and, thus raising the living standards of her people. Unfortunately, there have been major methodological problems in the estimation of crop production in developing countries, particularly in Africa. A number of methods of estimating crop production exist including the following: Food Balance sheet (Supply-Utilisation Table); Direct Weighing; Farmers' Estimates; Continuous Weighing; Measurements from Researchers; and a Product of Area and Yield. Each of these methods has strengths and weaknesses, particularly in Africa. In the 2008/09 UCA, Farmers' estimates method used for estimating crop production. Parcel and crop plot areas within Enumeration Area (EA) were measured using Global Positioning System (GPS) to achieve high level of accuracy.

Thus, collected data on crop area and production enables the analysis of the agricultural sector which is a source of livelihood for over ¾ of the Uganda's population. In the UBOS approach, production statistics, supply balances, price statistics and farm sample data are combined enabling the construction of food balance sheets at all levels of agricultural sector. The generated basic data sets provide sectoral as well as production activity with specific information on agricultural outputs and prices. Agricultural Income indicators are derived or checked with this approach and sectoral interactions can be observed in physical and monetary flows.

1.1.1 Census Objectives

Long Term Objective

The long-term objective is to have a FAS system in place.

Immediate Objectives

The immediate objective was to collect and generate the bench-mark data needed for the monitoring and evaluation of the agricultural sector at all levels through a nation wide UCA.

More specifically, the objectives of UCA were to provide:

- (ii) Data on the social and economic factors of a country's agricultural structure by inter-relating various characteristics of the holdings, e.g. size of holding and type of holding, and factors such as fragmentation, land tenure, land utilisation, crop patterns, use of fertilisers and agro-chemicals, use of farm implements and machinery, farm population and labour force;
- (iii) Detailed agricultural data, such as number of holdings, total area under holdings, basic pattern of land utilisation, area under crops and extent of irrigation;
- (iv) A bench mark for improving the reliability of current agricultural statistics from annual surveys and administrative sources and for assessing future agricultural development; and
- (v) Creation and strengthening of the national capacity in agricultural censuses and surveys taking.

1.1.2 Census Coverage

The UCA 2008/09 covered all the 80 districts in the country as of 1st July 2007 and a district was planned to be the domain of study i.e. census data was disaggregated at district level.

1.1.3 Census Scope

Small and Medium scale holdings constituted the sampling frame from which a sample was drawn. It was known that the contribution to production (crop and livestock) by the Private Large-Scale and Institutional Farms (PLS&IFs) was increasing over time. In light of this development, the PLS&IFs were covered on a complete enumeration basis. They were first listed to enable census office plan better for their enumeration.

The UCA 2008/09 collected data on various structural characteristics of the agricultural holdings such

as: Number and Size of holdings, Land tenure system, Demographic characteristics of the holder and his/her household, Use of agricultural labour; and Use of implements and farm machinery etc.

Data was also collected on: Crop area and crop production, Livestock numbers and Aquaculture.

1.2 Census Methodology

1.2.1 Census Organisation

The Uganda Census of Agriculture Office (UCA) was headed by a Director (D/UCA) who was assisted by a Deputy. It was divided into two (2) technical units namely: Census Technical/ Field Operations; and Data Processing Unit

- (i) A UCA Director based in the Agricultural Statistics Section of UBOS;
- (ii) A Deputy UCA Director; seconded from MAAIF
- (iii) Five (5) Statisticians based in the Agricultural Statistics Section of UBOS;
- (iv) Two (2) Statisticians based in MAAIF;
- (v) Twelve (12) Temporarily recruited Statisticians
- (vi) One (1) Technical Officer;
- (vii) Short and Long Term, Local and International Consultants.
- (viii) Data Processing Team: Data Processing Manager (1), Programmers (2), Data Entry Supervisors (4), Coding Supervisors (1), Coders(14), Data Entrants (60).

The census organisation was supported by computer expertise and other professionals within UBOS whenever need arose. The UCAO organised and ensured the overall coordination of the census, re enforced and worked hand in hand with District Supervisors. The UCAO Staff also acted as trainers and as National Supervisors during the data collection period. The various Technical Teams in UCAO regularly supervised the fieldwork to ensure that it was properly carried out and resolved any field problems.

Besides the staff at the headquarters, there was staff in the field. The first categories of this staff were the District Supervisors (DSs). The responsibility of a DS was mainly to follow up on the Enumerator's work; he/she also worked as a District Coordinator. A DS received all forms, checked for errors and advised the Enumerator concerned where to make corrections. Thereafter, he/she stored them at the district headquarters, before passing them on to UBOS for subsequent processing. The DS supervised the Enumerators regularly as well as participating actively during sampling of holdings.

The second categories of staff at the district were the Enumerators. These were employed to carry out the enumeration exercise i.e. actual collection of data from the respondents. The number of Enumerators per district depended on the number of EAs selected.

1.2.2 Tabulation Plan Preparation

Trend analysis and comparison purposes guided preparation of the tabulation plan. The Draft Tabulation Plan was prepared, exhaustively studied by the consultants, transformed into Dummy Tables and distributed to stakeholders. They were requested to critically evaluate the tables and suggest priority tables while keeping in mind the main objective of providing essential structural data (number, percentage and area of various items) for government to prepare plans and formulate policies for development. The tables show all districts (as of 1st July 2007) with the national totals in the last (bottom) row.

1.2.3 Sample Design

A stratified two-stage sample design was used for the small and medium-scale household-based agricultural holdings. At the first stage, Enumeration Areas (EAs) were selected with Probability Proportional to Size (PPS), and at the second stage, households which were the ultimate sampling units were selected using systematic sampling. A total of 3,787,487 out of the 5,186,558 households enumerated during the 2002 PHC reported that one or more of their members was/were engaged in an agricultural activity as of September 2002. These households were referred to as “households with agricultural activity” or “agricultural households”; Agricultural Module used during the PPS sampling process was advantageous since it was on a universal basis (i.e. *complete enumeration of households- synonymous with the core module as per FAOs standards*).

1.2.4 Questionnaire Design and Other Census Instruments

The principles of validity, optimisation and efficiency which refer to ability for the questionnaires to yield more reliable information per unit cost; measured as a reciprocal of the variance of the estimate and enables objective interpretation of the results was followed. While costs involved man hours and money expended for data collection from sampled units, the design of questionnaires had to collect minimum set of internationally comparable core data (indices) for Uganda, as enshrined in the pillars of FAO.

1.2.5 Field pre-testing of the Census instruments

A Pilot Census of Agriculture (PCA) was conducted in 2003 in the ten districts of Central (Masaka and Wakiso), Eastern (Iganga and Mbale), Northern (Arua, Lira and Nakapiripirit); Western (Kabale, Kabarole, Masindi) followed by A pre-test in Mityana district during the month of May 2008. The objectives of the pre-test were to; further test the suitability of instruments following the revision after the PCA 2003, and determine, field staff workloads.

1.3 Training of Trainers and Training of Supervisors and enumerators

The headquarter staff involved in the training was drawn mainly from the Agricultural Statistics Sections of UBOS and MAAIF. Training was carried out in three (3) phases namely:

- i) **Training of trainers:** This entailed headquarter staff to ensure that the trainers when dispatched to various training centers would issue similar instructions.
- ii) **Training of District Supervisors (DSs):** The main reason for carrying out a separate training for the DSs, was to ensure that when different centers of training for the Enumerators were established, the trained DSs would support the headquarter staff in the training. Due to their large number, the DSs were trained in two sessions each of about 60 participants to keep the class size manageable.
- iii) **Training of Enumerators:** This training was mainly facilitated by NSs assisted by DSs at seven (7) regional centers namely; Mukono, Jinja, Mbale, Lira, Arua, Mbarara, and Kabarole. Five (5) teams were constituted and some trained at more than one venue. The training had an advantage that those DSs who had missed out or had not completely understood some aspects on the previous training were given another chance to catch up.

Each team of field staff was trained for a period of seven (7) days. Five (5) were mainly for classroom work and the remaining two (2) days were spent on practical demonstrations on field activities, probing techniques and the use of GPS. The training was based on the questionnaires and Instructions Manuals.

Forms trained on had been designed according to various modules for data collection and included the following: The Listing Module, Agricultural House Hold and Holding Module, Crop Area Module, Crop Production Module and Private Large Scale and Institutional Farms Module

1.4 Community Mobilisation

Radio, Television, Newspapers, Leaflets, T-shirts and Caps were used to create awareness of census activities, mobilise communities and local authorities. This helped in publicising all the field level activities done throughout the reference period. The T-shirts and caps were given to the field staff that included all enumerators, guides country wide who helped in the listing process and identification of administrative boundaries, District Supervisors and National Supervisors. Radio talk-shows were held to reach out to the communities where data collection took place.

1.5 Field Supervision and Data collection

A D/UCA presided over the day-to-day running of the project and closely monitored field work including overall supervision;

Deputy D/UCA drawn from MAAIF, Technical Officer specifically hired to manage all the technical aspects of UCA, working hand in hand with principal statistician and senior statisticians provided on spot checks, data quality management and general overview of the supervisory work of questionnaires being collected from the field.

Sixteen teams comprised of Statisticians (National Supervisors) provided technical back-stopping to the filling-in of the questionnaires, acted as trainers and resolved any problems that arose during field work before questionnaires could be collected at district stores

Top level Supervisors were drawn from both UBOS and MAAIF and were involved in supervision to resolve some problems beyond the capability of NSs.

At every district, there was either a DS or two (2) DSs who were front-line supervisors. As such, the DSs were supposed to ensure that the Enumerators followed instructions given during the training and to oversee the overall administration of the census activities at the district level.

1.6 Data Management, Processing and Analysis

Completed questionnaires were continuously returned from the field and there was concurrent collection and processing of data. Data processing monitored the data quality parameters and the data quality team could continuously report to the field operations team who could in turn make feed back to the DSs for improvement. Returned questionnaires were subjected to the following steps: Coding, Data capture, Editing, Secondary Editing and Quality control.

1.6.1 Coding

This involved making sure that all forms/questionnaires had correct geographical identification information and crop codes. The coding team also verified holdings within an enumeration area to see that only eligible/sampled holdings were actually enumerated. The team also organized the forms belonging to an enumeration area into a batch. Forms in a batch were arranged according to the household serial numbers which eased the work of the data entry operator.

1.6.2 Data capture

Edited/coded forms were delivered to the data entry room(s) where actual data entry took place. There were three (3) data entry rooms each housing 16 data entry operators and managed by a data processing supervisor. The data processing supervisor was in charge of assigning and supervising work of the data entry operators. To eliminate data entry errors, a double entry system was used. Each round of data capture was done by a different data entrant. Data from both entries was continuously compared until there was no difference between the two. Batches that passed this check were considered free of any data entry errors. The first round of entry was referred to as “main entry” and the second “verification”.

1.6.3 Editing

This involved the process of identifying inconsistencies within the data and removing them. At the beginning of UCA data processing, a set of editing rules and guidelines were developed by the data processing team with technical guidance from the subject matter specialists. Many of these were incorporated into the data entry application and others were left for the secondary editing stage. Error checks in the entry applications helped the data entry operators to interactively see and correct errors during entry. Errors that were beyond the editors' ability to correct were reported to the supervisors for advice. This greatly contributed to the data collection feedback process which improved the data quality.

1.6.4 Secondary Editing

Errors that passed the data entry stage were subjected to the editing stage. This stage was meant to find inconsistencies within the data. It brought out problems that required subject matter specialists to resolve. To resolve most of such errors, consultations were made with the National Supervisors, District Supervisors, UBOS and MAAIF technical teams. In a few cases, especially for large farms, direct contacts were made to the respondent.

1.6.5 Quality Control

The UCA hired an external consultant who had very high expertise in data processing. The sole purpose of this was to ensure a very high quality dataset. With the technical help of the consultant, the data processing team was able to develop very strict and efficient quality processing applications. These helped to eliminate outliers and inconsistencies from the final dataset as much as possible.

1.6.6 Software and Hardware used for data processing:

- i) **Software:** This was constituted by:
 - Census and Survey Processing (CsPro) application which was used for data capture and management of the information within a batch and for data editing.
 - Ms Access and Visual Basic which were used for the general data management
 - STATA was used for data editing, import, export and analysis
 - Excel was used for presentation of results from the analysis

- ii) **Hardware:** This included Fifty three (53) desktop computers which were fully dedicated to data entry. They were distributed to various laboratories and each laboratory had a central computer (supervisor's machine) which was in charge of holding and distributing data entry application to the computers attached to it. It was also responsible for receiving data from the individual computers and this was automatically done.

1.7 Response Rate

The UCA 2008/09 had several forms namely UCA form 1: Listing Module; UCA form 2: Agricultural Households and Holding Characteristics Module; UCA form 4: Crop Area Module; UCA form 5: Crop Production Module and UCA form 6: PLS & IFs Module. Overall, the response rate was 93.5 percent.

1.8 Funding

The Government of Uganda funded the census of agriculture 2008/2009, a Pilot Census of Agriculture (PCA) that was carried out in 2003 and a further pre-test conducted in May 2008. Technical assistance was sought from F.A.O; Department for International Development (DFID) and World Bank during the preparatory and implementation stages while funding from the Royal Norwegian Government was used to include an Agricultural Module in the PHC 2002.

1.9 Reliability of Estimates

The estimates presented in this report were derived from a scientifically selected sample. Analysis of the UCA data was undertaken at national, regional and district levels.

On the basis of the scientifically selected sample and the high precision of the estimates as evidenced by the low Coefficients of Variation (CVs) of published estimates with CVs less than 20 percent, the results provide among other things, the most precise estimate of the total production and area of major crops in Uganda as of 2008 and should be used as a benchmark for any future livestock surveys and censuses in this country.

1.10 Further Analysis

Further analysis and generation of more indices to suit the long term objective of having a Food and Agriculture System (FAS) in place is possible. Originality of the data base has been maintained and securely backed up after the editing processes undertaken by the subject specialist before report writing.

1.11 Problems Encountered and Constraints

- Delayed disbursement of funds for field activities impacted negatively on the schedule of field operations.
- Insecurity in some parts of the country (Karamoja region). Enumerators, District Officials and Security Agencies expressed concern that some areas were not accessible due to insecurity (cattle rustling). In this regard, seven enumeration areas were not covered in Karamoja region.
- Resistance in some districts. There was resistance to the listing exercise; a case in point was in Masindi, Mubende, and Kyenjojo districts where there were EAs in which listing could not take

place due to resistance which impacted negatively on the district estimates and coefficients of variation.

- Bad terrain in mountainous areas and Islands. Accessibility was difficult in some Eastern parts of the country (Bugisu region: Bududa and parts of Sironko Districts), Sebei Region (Kapchwoa and Bukwo Districts), Lake Victoria Islands that form Kalangala District and Sigulu Islands.
- Erratic weather patterns and Poor roads. Floods disrupted and delayed data collection exercise and in Karamoja Sub-region, roads were nearly impassable during rainy seasons.

CHAPTER TWO

AGRICULTURAL HOUSEHOLD AND HOLDING CHARACTERISTICS

2.1 Introduction

This chapter discusses the general structural data collected during the UCA; the Number of agricultural holdings, holding size, Land ownership, Shifting cultivation, Parcels and Plots operated by the holding. This information will only be reported for the second season of 2008, the time when census had just started.

2.2 Number of Agricultural Households

An agricultural holding refers to an economic unit of agricultural production under single management comprising of livestock kept and all land used wholly or partly for agricultural production purposes, without regard to title, legal form or size. During UCA 2008/09, information was collected on Ag HHs and it was found that Uganda has about 3.95 million Ag HHs of which about 20 per cent are female headed as shown in Table 2.1. The Western Region with 28.5 percent had the highest percentage of Ag HHs followed by the Eastern Region (28.1%) while the Central Region had the least (21%).

Table 2. 1: Growth of Agricultural Households over the years ('000)

Region	UNHS 1995/6	UNHS 1999/2000	PHC 2002	UNHS 2005/06	UCA 2008/09
Central	768	790	835	1,014	807
Eastern	896	922	1,041	1,103	1,109
Northern	544	718	871	866	905
Western	992	874	1,086	1,169	1,125
Uganda	3,200	3,300	3,833	4,151	3,946

Overall, AgHHs have been increasing over the years. Although the total number of Ag HHs during the UCA is less than that given by UNHS 2005/06, it **does not imply** that there has been a decline in Ag HHs. The totals are different because of the different methods used in estimation. Unlike in the UNHS where an open segment method was used, during the UCA a closed segment method was used (as recommended by FAO) such that a HH was considered to be an Ag HH if it had at least one agricultural activity within the EA. This implied that HHs whose agricultural activities were outside EA were not taken to be Ag HHs.

Figure 2. 1: Regional Trends in the growth of Ag HHs over the years in thousands

Figure 2. 2: Trends in the growth of Agricultural Households over the years in thousands in Uganda

2.3 Number and Location Parcels

A parcel refers to any piece of land that is part of a holding, but is entirely surrounded by other land, water, a road, or a forest, etc, not forming part of the holding; a parcel is physically separate from other parts of holding. A holding may have one or more parcels. The census results revealed that there were 6.6 million parcels were within EA. A part from parcels within EA, Ag HHs may have parcels outside EA and their numbers are given below by season and region.

Table 2.2: Location of Parcels during the Second Season of 2008

Region	Location				
	Within EA	Outside EA but within same parish	Outside EA parish but within same sub county	Elsewhere in the district	Outside the district
Central	1,074,670	78,010	18,298	5,952	1,425
Eastern	1,696,852	171,136	41,094	13,777	6,558
Northern	1,777,862	138,935	38,446	21,685	4,845
Western	2,034,758	241,364	57,447	23,315	7,222
Uganda	6,584,142	629,445	155,285	64,729	20,050

2.4 Parcel Ownership

During the UCA, information was collected on parcel ownership. An Ag HH may use a parcel (land) it *owns* or *rented in* for in kind or monetary return. A parcel may be rented for: an agreed amount of money, produce, or service. Of the parcels that were within EA, 93 percent were owned by the Ag HHs while the rest were rented in for some reward in kind or for monetary exchange.

Table 2. 3: Distribution of parcels by Ownership and Region in second season of 2008

Region	Form of Ownership				
	Owned	Rented for agreed amount of money &/or produce	Rented for share of produce	Rented for exchange of services	Other
Central	955,652	68,242	14,349	6,969	24,147
Eastern	1,557,041	99,262	6,727	5,653	17,130
Northern	1,706,434	42,314	1,885	3,097	17,221
Western	1,889,886	94,544	13,173	10,423	19,279
Uganda	6,109,013	304,362	36,133	26,141	77,777

2.5 Shifting Cultivation

Shifting cultivation is a farming practice whereby a particular piece of land is cultivated for some years and then abandoned for a period sufficient to restore its fertility by natural vegetative growth before being re-cultivated. Only about 26 percent of Ag HHs practiced shifting cultivation on about 21 percent of the parcels located within EA.

Table 2. 4: Ag HHs that practiced shifting cultivation and the Number of parcels on which it is practiced

Region	Ag HH practicing Shifting cultivation	Parcels on which shifting cultivation is done
Central	204,098	271,348
Eastern	181,134	259,390
Northern	222,275	432,081
Western	285,095	448,926
Uganda	892,601	1,411,746

2.6 Period (in years) since Parcel was cleared

For parcels within EA, information was collected on the period since the parcel was first cleared. Results show that about 51 percent of parcels had been cleared over four years prior to UCA while 18 percent had been cleared under one year ago which indicates that there is still opening of new fields for agricultural production.

Table 2. 5: Distribution of parcels by Period (in years) since cleared

Region	Period since cleared		
	Under one year ago	1-3 Years ago	4 or more years ago
Central	151,308	202,117	630,181
Eastern	218,399	182,216	958,379
Northern	421,893	372,522	714,811
Western	377,400	298,427	1,052,739
Uganda	1,169,000	1,055,282	3,356,109

2.7 Average Holding Size (AHS)

The AHS is the total agricultural land operated by Ag HHs whether owned and rented -in or even borrowed minus land rented out divided by the number of Agricultural Households. The national AHS is 1.1 Ha. The Northern Region had the Highest AHS of 1.6 Ha while the Western Region had the least with 0.8Ha.

Figure 2. 3: Average Holding Size by Region

2.8 Number and Mean Plot Size (MPS) of Crop Plots

A plot is any a piece of land within a parcel or equivalent to a parcel on which a specific crop or crop mixture is grown; a plot is also known as a field.

2.8.1 Maize

The estimated number of plots under maize was 2.9 million. Out of these, 1.4 million (47.1%) were of pure stand while 1.5 million (52.9%) were of mixed stand.

The regional figures indicate that, the Northern Region with 63.1 percent had the highest percentage of its maize plots in pure stand followed by the Western Region (47.3%) while the Eastern Region had the least (40.7%).

The national MPS was estimated to be 0.35 Ha. The Northern Region had the highest estimated MPS of 0.39 Ha followed by the Central Region with 0.37 Ha while the Eastern Region had the least (0.32 Ha). The estimated MPSs for UNHS 1995/96, UNHS 1999/00 and UNHS 2005/06 were 0.20, 0.28 and 0.18 Ha respectively.

The details are as shown in Table 2.6 and Figure 2.4.

Table 2.6: Distribution of Maize Plots and MPSs by Region

District	Plots for 2008/09				Total	Area (Ha)	Mean Plot Size
	Pure	%	Mixed	%			
Central	212,234	42.0	293,067	58.0	505,301	189,135	0.37
Eastern	489,435	40.7	714,046	59.3	1,203,481	388,762	0.32
Northern	397,476	63.1	232,319	36.9	629,795	247,780	0.39
Western	252,986	47.3	282,091	52.7	535,077	188,583	0.35
Uganda	1,352,130	47.1	1,521,523	52.9	2,873,654	1,014,260	0.35

Figure 2.4: Percentage Distribution of Maize Plots by Pure and Mixed Stand and by Region

2.8.2 Finger Millet

The number of plots under Finger Millet was estimated to be 936,000. Out of these, 459,000 (49.0%) were of pure stand while 477,000 (51.0%) were of mixed stand.

In terms of regions, the Central Region with 61.7 percent had the highest percentage of its Finger millet plots in pure stand followed by the Western Region (58.7%) while the Eastern Region had the least (44.4%).

The national MPS was estimated to be 0.27 Ha. The Northern Region had the highest estimated MPS of 0.34 Ha followed by the Eastern Region with 0.25 Ha while the Western Region had the least (0.20 Ha). The estimated MPSs for UNHS 1995/96, UNHS 1999/00 and UNHS 2005/06 were 0.27, 0.32 and

0.19 Ha respectively.

The details are provided in Table 2.7 and Figure 2.5.

Table 2.7: Distribution of Finger Millet Plots and MPSs by Region

District	Plots for 2008/09				Total	Area (Ha)	Mean Plot Size
	Pure	%	Mixed	%			
Central	15,885	61.7	9,861	38.3	25,746	5,832	0.23
Eastern	151,584	44.4	189,600	55.6	341,184	86,911	0.25

Western	150,935	58.7	106,176	41.3	257,111	51,588	0.20
Uganda	458,618	49.0	477,266	51.0	935,884	249,987	0.27

Figure 2.5: Percentage Distribution of Finger Millet Plots by Pure and Mixed Stand and by Region

2.8.3 Sorghum

The total number of plots under sorghum was estimated to be 1.2 million. Out of these, 824,000 (68.0%) were of pure stand while 388,000 (32.0%) were of mixed stand.

In terms of regions, the Central Region with 82.2 percent had the highest percentage of its sorghum plots under pure stand followed by the Eastern Region with 81.2 percent and the Northern Region had the least (56.7 percent).

The national MPS was estimated to be 0.33 Ha. The Northern Region had the highest estimated MPS of 0.43 Ha followed by the Eastern Region with 0.28 Ha while the Central Region had the least (0.15 Ha). The UNHS 1995/96, UNHS 1999/00 and UNHS 2005/06 estimated MPSs were 0.27, 0.27 and 0.20 Ha respectively.

The details are as shown in Table 2.8 and Figure 2.6.

Table 2.8: Distribution of Sorghum Plots and MPSs by Region

District	Plots for 2008/09				Total	Area (Ha)	Mean Plot Size
	Pure	%	Mixed	%			
Central	12,657	82.2	2,741	17.8	15,398	2,261	0.15
Eastern	293,028	81.2	67,972	18.8	361,000	101,645	0.28
Northern	327,951	56.7	250,170	43.3	578,121	249,330	0.43
Western	190,649	73.9	67,395	26.1	258,044	46,016	0.18
Uganda	824,285	68.0	388,278	32.0	1,212,563	399,252	0.33

Figure 2.6: Percentage distribution of Sorghum Plots by Pure and Mixed Stand and by Region

2.8.4 Rice

The estimated total number of plots under Rice was 187,000. Out of these, 152,000 (81.3%) were of pure stand while only 35,000 (18.7%) were of mixed stand.

In terms of regions, the Eastern Region had the highest percentage (94.3%) of its rice plots under pure stand followed by the Central Region with 77.6 percent and the least was the Western Region with 65.7 percent.

The national MPS was estimated to be 0.40 Ha. The Northern Region had the highest estimated MPS of 0.45 Ha followed by the Central Region with 0.42 Ha while the Western Region had the least (0.33 Ha).

The details are as shown in Table 2.9 and Figure 2.7

Table 2.9: Distribution of Rice Plots and MPSs by Region

District	Plots for 2008/09				Total	Area (Ha)	Mean Plot Size
	Pure	%	Mixed	%			
Central	4,862	77.6	1,406	22.4	6,268	2,637	0.42
Eastern	86,027	94.3	5,156	5.7	91,183	36,033	0.40
Northern	40,270	69.6	17,609	30.4	57,879	25,912	0.45

Figure 2.7: Percentage Distribution of Rice Plots by Pure and Mixed Stand and by Region

2.8.5 Beans

The total number of plots under beans was estimated to be 2.3 million. Out of these, 804,000 (35.3%) were of pure stand while 1.5 million (64.7%) were of mixed stand.

In terms of regions, the Central Region had the highest percentage (76.9%) of its beans plots under mixed stand followed by the Western Region with 66.1 percent while the Northern Region had the least (45.0%).

The national MPS was estimated to be 0.27 Ha. The Northern Region had the highest estimated MPS of 0.37 Ha followed by the Eastern Region with 0.33 Ha while the Western Region had the least (0.23 Ha). The estimated MPSs for UNHS 1995/96, UNHS 1999/00 and UNHS 2005/06 were 0.17, 0.21 and 0.13 Ha respectively

The details are as shown in Table 2.10 and Figure 2.8

Table 2.10: Distribution of Beans Plots and MPSs by Region

District	Plots for 2008/09				Total	Area (Ha)	Mean Plot Size
	Pure	%	Mixed	%			
Central	111,433	23.1	372,006	76.9	483,439	120,798	0.25

Figure 2.8: Percentage Distribution of Beans Plots by Pure and Mixed Stand and by Region

2.8.6 Field Peas

The total number of plots under Field Peas was estimated to be 132,000. Out of these, 95,000 (72.0%) were of pure stand while 37,000 (28.0%) were of mixed stand.

In terms of regions, the Western Region with 84.9 percent had the highest percentage of its Field Peas plots in pure stand followed by the Eastern Region (74.0%) while the Central Region had the least (46.6%).

The national MPS was estimated to be 0.33 Ha. The Northern Region had the highest estimated MPS of 0.44 Ha followed by the Eastern Region with 0.26 Ha while the Central Region had the least (0.18 Ha). The estimated MPS for UNHS 2005/06 was 0.22 Ha.

The details are provided in Table 2.11 and Figure 2.9

Table 2.11: Distribution of Field Peas Plots and MPSs by Region

District	Plots for 2008/09				Total	Area (Ha)	Mean Plot Size
	Pure	%	Mixed	%			
Central	1,185	46.6	1,356	53.4	2,541	470	0.18

Figure 2.9: Percentage Distribution of Field Peas Plots by Pure and Mixed Stand and by Region

2.8.7 Cow Peas

The estimated total number of plots under Cow Peas was 77,000. Out of these, 57,000 (74.7%) were of pure stand while 20,000 (25.3%) were of mixed stand.

In terms of regions, the Western Region with 81.0 percent had the highest percentage of its maize plots in pure stand followed by the Eastern Region (73.7%) while the Central Region had the least (70.7%).

The MPS was estimated to be 0.31 Ha. Both the Central and the Northern Regions with 0.43 Ha had the highest estimated MPSs while the Western Region had the least MPS (0.10 Ha).

The details are as shown in Table 2.12 and Figure 2.10

Table 2.12: Distribution of Cow Peas Plots and MPSs by Region

District	Plots for 2008/09				Total	Area (Ha)	Mean Plot Size
	Pure	%	Mixed	%			
Central	1,857	70.7	769	29.3	2,626	1,135	0.43

Figure 2.10: Percentage Distribution of Cow Peas Plots by Pure and Mixed Stand and by Region

2.8.8 Pigeon Peas

The total number of plots under Pigeon Peas was estimated to be 59,000. Out of these, 36,000 (60.9%) were of pure stand while 23,000 (39.1%) were of mixed stand.

In terms of regions, the Western Region with 100 percent had the highest percentage of its Pigeon Peas plot in pure stand followed by the Northern Region (61.0%) while the Central Region did not have Pigeon Peas plots.

The national MPS was estimated to be 0.51 Ha. The Northern Region had the highest estimated MPS of 0.51 Ha followed by the Eastern with 0.42 Ha while the Western Region had 0.30 Ha. The estimated MPS for UNHS 2005/06 was 0.22 Ha.

The details are provided in Table 2.13 and Figure 2.11.

Table 2.13: Distribution of Pigeon Peas Plots and MPSs by Region

District	Plots for 2008/09				Total	Area (Ha)	Mean Plot Size
	Pure	%	Mixed	%

Figure 2.11: Percentage Distribution of Pigeon Peas Plots by Pure and Mixed stand and by Region

2.8.9 Groundnuts

The total number of plots under Groundnuts was estimated to be 1.4 million. Out of these, 676,000 (47.9%) were of pure stand 734,000 (52.1%) were of mixed stand.

In terms of regions, the Northern Region with 52.4 percent had the highest percentage of its Groundnuts plots in pure stand followed by the Eastern Region (49.8%) while the Central Region had the least (35.2%).

The national MPS was estimated to be 0.24 Ha. The Northern Region had the highest estimated MPS of 0.30 Ha followed by the Eastern Region with 0.28 Ha while the Western Region had the least (0.16 Ha). The estimated MPSs for UNHS 1999/00 and UNHS 2005/06 were 0.25 and 0.15 Ha respectively.

The details are provided in Table 2.14 and Figure 2.12.

Table 2.14: Distribution of Groundnuts Plots and MPSs by Region

District	Plots for 2008/09				Total	Area (Ha)	Mean Plot Size
	Pure	%	Mixed	%			
Central	53,320	35.2	98,316	64.8	151,636	26,504	0.17

2.8.10 Simsim

The total number of plots under Simsim was estimated to be 467,000. Out of these, 319,000 (68.1%) were of pure stand while 149,000 (31.9%) were of mixed stand.

In terms of regions, the Western Region with 77.9 percent had the highest percentage of its Simsim plots in pure stand followed by the Eastern Region (70.8%) while the Central Region had the least (43.1%).

The national MPS was estimated to be 0.38 Ha. The Northern Region had the highest estimated MPS of 0.39 Ha followed by the Western Region with 0.31 Ha while the Central Region had the least (0.18 Ha). The estimated MPS for UNHS 2005/06 was 0.25 Ha.

The details are provided in Table 2.15 and Figure 2.13.

Table 2.15: Distribution of Simsim Plots and MPSs by Region

District	Plots for 2008/09				Total	Area (Ha)	Mean Plot Size

2.8.11 Soya Beans

The total number of plots under Soya Beans was estimated to be 106,000. Out of these, 62,000 (58.2%) were of pure stand while 44,000 (41.8%) were of mixed stand.

In terms of regions, the Northern Region with 64.0 percent had the highest percentage of its Soya Beans plots in pure stand followed by the Eastern Region (50.7%) while the Central Region had the least (37.1%).

The national MPS was estimated to be 0.34 Ha. The Northern Region had the highest estimated MPS of 0.40 Ha followed by the Central Region with 0.32 Ha while the Western Region had the least (0.18 Ha). The estimated MPS for UNHS 2005/06 was 0.14 Ha.

The details are provided in Table 2.16 and Figure 2.14.

Table 2.16: Distribution of Soya Beans Plots and MPSs by Region

District	Plots for 2008/09				Total	Area (Ha)	Mean Plot Size

2.8.12 Banana (Food)

The total number of plots under Banana (Food) was estimated to be 2.9 million. Out of these, 1.1 million (39.0%) were of pure stand while 1.8 (61.0%) were of mixed stand.

In terms of regions, the Northern Region with 61.6 percent had the highest percentage of its Banana (Food) plots in pure stand followed by the Western Region (41.4%) while the Eastern Region had the least (34.1%).

The national MPS was estimated to be 0.28 Ha. The Central Region had the highest estimated MPS of 0.30 Ha followed by the Western Region with 0.29 Ha while both the Eastern and Northern Regions had the least (0.20 Ha). The estimated MPS for UNHS 2005/06 was 0.18 Ha.

The details are provided in Table 2.17 and Figure 2.15.

Table 2.17: Distribution of Banana (Food Type) Plots and MPSs by Region

District	Plots for 2008/09				Total	Area (Ha)	Mean Plot Size
	Pure	%	Mixed	%

2.8.13 Banana (Beer Type)

The total number of plots under Banana (Beer Type) was estimated to be 208,000. Out of these, 114,000 (54.9%) were of pure stand while 94,000 (45.1%) were of mixed stand.

In terms of regions, the Northern Region with 100 percent had the highest percentage of its Banana (Beer Type) plots in pure stand followed by the Western Region (61.2%) while the Eastern Region had the least (32.2%).

The national MPS was estimated to be 0.41 Ha. The Northern Region had the highest estimated MPS of 0.90 Ha followed by the Western Region with 0.42 Ha while the Eastern Region had the least (0.40 Ha).

The details are provided in Table 2.18 and Figure 2.16

Table 2.18: Distribution of Banana (Beer Type) Plots and MPSs by Region

District	Plots for 2008/09				Total	Area (Ha)	Mean Plot Size

2.8.14 Banana (Sweet Type)

The number of plots under Banana (Sweet Type) was estimated to be 76,000. Out of these, 39,000 (51.5%) were of pure stand while 37,000 (48.5%) were of mixed stand.

In terms of regions, the Northern Region with 72.4 percent had the highest percentage of its Banana (Sweet Type) plots in pure stand followed by the Eastern Region (62.7%) while the Central Region had the least (26.3%).

The national MPS was estimated to be 0.31 Ha. The Eastern Region had the highest estimated MPS of 0.51 Ha followed by the Central Region with 0.36 Ha while the Northern Region had the least (0.20 Ha).

The details are provided in Table 2.19 and Figure 2.17.

Table 2.19: Distribution of Banana (Sweet Type) Plots and MPSs by Region

District	Plots for 2008/09				Total	Area (Ha)	Mean Plot Size

2.8.15 Cassava Plots

The number of plots under Cassava Plots was estimated to be 3.1 million. Out of these, 1.9 million (61.2%) were of pure stand while 1.2 million (38.8%) were of mixed stand.

In terms of regions, the Eastern Region with 70.2 percent had the highest percentage of its Cassava Plots in pure stand followed by the Northern Region (59.7%) while the Central Region had the least (48.7%).

The national MPS was estimated to be 0.28 Ha. The Eastern Region had the highest estimated MPS of 0.31 Ha followed by the Northern Region with 0.27 Ha while the Central and Western Regions had the least (0.25 Ha). The estimated MPS for UNHS 1999/00 and UNHS 2005/06 were 0.26 and 0.15 Ha respectively.

The details are provided in Table 2.20 and Figure 2.18.

Table 2.20: Distribution of Cassava Plots and MPSs by Region

District	Plots for 2008/09				Total	Area (Ha)	Mean Plot Size
	Pure	%	Mixed	%

2.8.16 Sweet Potatoes

The total number of plots under Sweet Potatoes was estimated to be 2.7 million. Out of these, 2.3 million (83.4%) were of pure stand while 451,000 (16.6%) were of mixed stand.

In terms of regions, the Northern Region with 95.3 percent had the highest percentage of its Sweet Potatoes plots in pure stand followed by the Eastern Region (91.6%) while the Central Region had the least (68.2%).

The national MPS was estimated to be 0.16 Ha. The Eastern Region had the highest estimated MPS of 0.19 Ha while Central, Northern and Western Regions had equal MPS of 0.15 Ha. The estimated MPSs for UNHS 1995/96, UNHS 1999/00 and UNHS 2005/06 were 0.14, 0.16 and 0.14 Ha respectively.

The details are provided in Table 2.21 and Figure 2.19.

Table 2.21: Distribution of Sweet Potatoes Plots and MPSs by Region

District	Plots for 2008/09				Total	Area (Ha)	Mean Plot Size
	Pure	%	Mixed	%

2.8.17 Irish Potatoes

The total number of plots under Irish Potatoes was estimated to be 270,000. Out of these, 163,000 (60.3%) were of pure stand while 107,000 (39.7%) were of mixed stand.

In terms of regions, the Eastern Region with 91.5 percent had the highest percentage of its Irish Potatoes plots in pure stand followed by the Northern Region (83.8%) while the Central Region had the least (59.3%).

The national MPS was estimated to be 0.12 Ha. The Eastern Region had the highest estimated MPS of 0.28 Ha followed by the Central Region with 0.21 Ha while the Western Region had the least (0.11 Ha). The estimated MPSs for UNHS 1995/96, UNHS 1999/00 and UNHS 2005/06 were 0.14, 0.16 and 0.10 Ha respectively.

The details are provided in Table 2.22 and Figure 2.20.

Table 2.22: Distribution of Irish Potatoes Plots and MPSs by Region

CHAPTER THREE

AREA, PRODUCTION AND DISPOSITION OF MAJOR CROPS

3.1 Introduction

The UCA collected information on Agricultural Area, Production and Disposition of crops during and the Second Season of 2008 and First Season 2009. This information is therefore discussed herein by season.

Maize, Beans, Banana (Food), Cassava and Sweet Potatoes were the crops grown by most of the Ag HHs in the country, with each grown by over one million households in each of the two seasons. Of these five major crops, maize carried the day with over 1.5 million AgHHs growing the crop in each season.

For the commonly grown crops mentioned above and during the Second Season of 2008, the Eastern Region had the highest number of Ag HHs that grew Maize (578,000), Cassava (373,000) and Sweet Potatoes (356,000) while the Western Region led in the number of Ag HHs that that grew Beans (696,000) and Banana-Food (696,000).

Results from the Second Season of 2008 further revealed that, within the Central Region, most Ag HHs grew Banana-Food (460,000), followed by Maize (410,000), Beans (366,000) and Cassava (279,000).

The details are provided in Tables 3a and 3b.

Table 3a: Percentage Distribution of Ag HHs by type of crop produced by Region (2nd Season of 2008)

Region	Central		Eastern		Northern		Western		Total	
	Number	%	Number	%	Number	%	Number	%	Number	%

3.2 Production (Mt) and Area of Major Crops

3.2.1 Maize

The national production of maize during the period under reference was 2.4 million Mt, which came from an estimated area of one (1) million hectare (Ha). There was no big difference in the quantity of production from both the second and first season; both seasons had about 1.2 million Mt.

In terms of regions, the Eastern Region reported the highest production of maize with the total output of 1.1 million Mt (46.9 %) followed by the Western Region with 21.1 percent and the least was the Northern Region with 12.9 percent.

The Eastern Region with 2.9 Mt/Ha had the highest Maize yield, followed by the Western Region with 2.6 Mt/Ha while the Northern Region reported the least yield (1.2 Mt/Ha).

The production trend of maize showed an increase of 37.6 percent from 537,000 Mt in UNHS 1995/96 to 739,000 Mt in UNHS 1999/2000 and it tripled in UNHS 2005/06 then slightly dropped to 2,362,000 Mt in UCA 2008/09

Iganga district was the leading producer of maize with a total of 303,000 Mt from an area of 49,000 Ha followed by Mubende with 171,000 Mt from an area of 41,000 Ha and the third district was Soroti district with a total of 138,000 Mt from an area of 15,000 Ha. Kampala and Katakwi districts were the least producers of maize with the total output of 776 Mt, 255Mt respectively.

The details are provided Table 3.1, Figures 3.1 and 3.2 and Table A3.1 in Annex.

Table 3. 1: Total Area and Total Production of Maize by region

Region	Second season 2008		First season 2009		Total for 2008/09		Yield (Mt/Ha)
	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	
Central	105,192	295,104	83,943	154,756	189,135	449,859	2.4
Eastern	167,794	468,048	220,968	640,506	388,762	1,108,554	2.9
Northern	95,773	143,594	152,007	162,204	247,780	305,798	1.2
Western	96,588	257,579	91,995	240,166	188,583	497,745	2.6
Uganda	465,347	1,164,324	548,913	1,197,632	1,014,260	2,361,956	2.3

Figure 3. 1: Percentage Distribution of production of Maize by region

Figure 3. 2: Maize Production Trend 1995/96 – 2008/09

3.2.2 Finger Millet

The national production of Finger Millet during the UCA 2008/09 was estimated to be 277,000 Metric tons (Mt) from an area of 250,000 Hectares (Ha), with a higher percentage of this production (163,000 Mt or 58.9%) having been realised from the Second Season of 2008. It is worth noting that much as there was an increase in area under the crop from 116,000 Ha to 134,000 Ha (16%) between Second Season 2008 and First Season of 2009 there was a decrease in production from 163,000 Mt to 114,000 Mt.

The overall yield of Finger Millet was 1.1 Mt/Ha. This was lower than what was realised in the Central Region (2.4 Mt/Ha), Western Region (1.5 Mt/Ha) and Eastern Region (1.2 Mt/Ha) but higher than the yield reported in the Northern Region (0.7 Mt/Ha).

In terms of regions, the Eastern Region with 107,000 Mt (38.6%) had the highest Finger Millet output followed by the Northern Region with 79,000 Mt (28.4%) while the Central Region with a production of 14,000 Mt had the least percentage (5.0 %).

The production of Finger Millet registered a downward trend from 193 Mt in UNHS 1995/96 to 184 Mt in UNHS 1999/00 and then a slight increase to 189 Mt in 2005/06. However, the UCA 2008/09 recorded a further increase to 274 Mt from 189 Mt between 2005/06 and 2008/09.

District level figures revealed that; Soroti district with 30,000 Mt produced the biggest quantity of Finger Millet in the country. This was followed by Tororo (26,000 Mt), Ntungamo (20,000 Mt) and then Amuru with 13,000 Metric tons. On the other hand the districts that reported no production of Finger Millet during the reference period included Kalangala, Kampala, Luwero, Wakiso, Mityana, Kapchorwa, Nakapiripirit and Bundibugyo.

The details are provided Table 3.2, Figures 3.3 and 3.4 and Table A3.2 in Annex.

Table 3. 2: Total Area and Total Production of Finger Millet by Region

Region	Second season 2008		First season 2009		Total for 2008/09		Yield (Mt/Ha)
	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	
Central	4,077	12,924	1,755	811	5,832	13,734	2.4
Eastern	26,025	28,609	60,886	78,230	86,911	106,838	1.2
Northern	38,061	49,693	67,595	28,879	105,656	78,572	0.7
Western	47,713	71,833	3,875	5,950	51,588	77,784	1.5
Uganda	115,876	163,058	134,111	113,870	249,987	276,928	1.1

Figure 3. 4: Finger Millet Production Trend 1995/96 – 2008/09

Source: UNHS 1995/96, 1999/2000 and 2005/06 Respective Reports

3.2.3 Sorghum

The national production of Sorghum was estimated to be 376,000 Mt from an area of 399,000 Ha. The biggest percentage of this output (217,000 Mt or 57.9%) was produced in the Second Season 2008.

The overall yield of sorghum was estimated at 0.9 Mt/Ha. This was lower than the yield realised in all regions except the Northern Region with 0.7 Mt/Ha.

The Northern Region with 177,000 Mt (47.1%) reported the highest production of Sorghum, followed by the Eastern Region with 133,000 Mt (35.5%) while the Central Region (2,700 Mt or 0.7%) had the least production.

Overall, Soroti district with 46,000 Mt (13.1%) was the largest producer of Sorghum in the country. It was followed by Tororo (35,000 Mt), Ntungamo (23,000 Mt) and then Pader (20,000 Mt).

A comparison of the production of the crop by districts within regions revealed that the districts of Rakai (1,300 Mt), Soroti (46,000 Mt), Pader (20,000 Mt) and Ntungamo (23,000 Mt) were the major producers of Sorghum in the Central, Eastern, Northern and Western regions respectively.

The production of Sorghum registered a downward trend from 203,000 Mt to 113,000 Mt between 1995/96 and 1999/2000. However, a positive trend was observed from 113,000 Mt in the year 1999/2000 to 376,000Mt during the UCA 2008/09.

The details are provided Table 3.3, Figures 3.5 and 3.6 and Table A3.3 in Annex.

Table 3. 3: Total Area and Total Production of Sorghum by region

Region	Second season 2008		First season 2009		Total for 2008/09		Yield (Mt/Ha)
	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	
Central	1,594	1,965	667	713	2,261	2,678	1.2
Eastern	54,681	67,592	46,964	65721	101,645	133,313	1.3
Northern	129,627	124,578	119,703	52510	249,330	177,088	0.7
Western	14,437	23,330	31,579	39386	46,016	62,716	1.4
Uganda	200,338	217,465	198,914	158,330	399,252	375,795	0.9

Figure 3. 5: Percentage Distribution of Sorghum production by region

Figure 3.6: Sorghum Production Trend 1995/96 – 2008/09

3.2.4 Rice

The national production of rice during the UCA 2008/09 was estimated to be 191,000 Mt from an area of 75,000 Ha. The highest percentage of this production (136,000 Mt or 71.2%) was realised from Second Season of 2008.

The overall yield of rice at the national level was 2.5 Mt/Ha. The Eastern Region with 3.6 Mt/Ha recorded the highest yield of rice followed by the Northern Region with 1.7 Mt/Ha while the Central Region had the lowest (0.8 Mt/Ha).

In terms of regions, the Eastern Region with 128,000 Mt (67.2 %) had the highest percentage of rice produced during the reference year, followed by the Northern Region with 44,000 Mt (22.9 %) while the Central Region reported the least (2,200 Mt or 1.1%).

The trend for rice production has been increasing from the 42 Mt recorded in the UNHS 1999/2000 to 180,000 Mt in 2005/05 then to 191,000 Mt as in revealed by UCA 2008/09.

The details are provided Table 3.4, Figures 3.7 and 3.8 and Table A3.4 in Annex.

Table 3. 4: Total Area and Total Production of Rice by region

Region	Second season 2008		First season 2009		Total for 2008/09		Yield (Mt/Ha)
	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	
Central	1,000	1,086	1,637	1,087	2,637	2,173	0.8
Eastern	16,902	89,635	19,131	38,559	36,033	128,195	3.6
Northern	12,598	32,053	13,314	11,666	25,912	43,719	1.7
Western	8,303	13,211	2,201	3,438	10,504	16,649	1.6
UGANDA	38,803	135,985	36,282	54,750	75,085	190,736	2.5

Figure 3. 7: Percentage Distribution of rice production by region.

Figure 3. 8: Rice Production Trend 1999/2000 – 2008/09

3.2.5 Beans

The national production of beans during the UCA 2008/09 was 929,000 Mt, from an estimated area of 618,000 Ha. The highest percentage of this production (546,000 Mt or 58.7%) was realised from Second Season of 2008.

The overall yield of beans at the national level was 1.5 Mt/Ha. The Northern and Western Regions both with 1.7 Mt/Ha recorded the highest yield of beans followed by the Central Region with 1.4 Mt/Ha while the Eastern Region had the lowest (0.9 Mt/Ha).

In terms of regions, the Western Region with 412,000 Mt (44.3 %) had the highest percentage of rice produced during the reference year, followed by the Northern Region with 251,000 Mt (27.0 %) while the Eastern Region reported the least (99,000 Mt or 10.6%).

There has generally been an increasing trend in Bean production between 1995/96 and 2008/09. Beans registered an increase in production from 336,000 Mt in 1995/96 to 496,000 Mt in 1999/2000 and 665,000 Mt in 2005/06 and then increased to 929,000 Mt in 2008/09

Ntungamo district is the leading producer of beans with a total of 138,000 Mt from an area of 43,000 Ha followed by Mubende with 78,000 Mt from an area of 28,000 Ha and Amuru district was third with 75,000 Ha from 10,000 Ha. It should be noted that although Ntungamo district is the leading producer of beans, Amuru district has the highest beans yield of about 7.4 Mt/Ha. Kamapala, Kalangala and Adjumani districts are the lowest producers of beans with 67, 55 and 30 Mt respectively.

The details are provided Table 3.5, Figures 3.9 and 3.10 and Table A3.5 in Annex.

Table 3. 5: Total Area and Total Production of Beans by region

Region	Second season 2008		First season 2009		Total for 2008/09		Yield (Mt/Ha)
	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	
Central	63,908	72,101	56,890	95,175	120,798	167,276	1.4
Eastern	54,484	55,177	53,623	43,658	108,107	98,834	0.9

Uganda	315,431	545,787	302,090	383,490	617,521	929,278	1.5

Figure 3. 9: Percentage Distribution of production of Beans by region

Figure 3. 10: Beans Production Trend UNHS 1995/96 – 2008/09

3.2.6 Field Peas

The national production of Field Peas during the UCA 2008/09 was estimated to be 16,000 Mt from an area of 44,000 Ha.

The highest percentage of this production (11,000 Mt or 70.0 %) was realised from Second Season of 2008.

The overall yield of Field Peas at the national level was 0.4 Mt/Ha. This was lower than what was realised in the Central Region (0.6 Mt/Ha) but the same as what was observed in all the other regions.

In terms of regions, the Northern Region with 10,400 Mt (63.4 %) had the highest percentage of Field Peas produced during the reference year, followed by the Eastern Region with 3,200 Mt (19.7 %) while the Central Region reported the least (300 Mt or 1.8%).

The Field Peas production trend showed an upward trend from 5,000 Mt in 2005/06 to 16,000 Mt in 2008/09 although there was a decline between 1999/2000 to 2005/06.

At district level the largest four Field Peas producers were Oyam with 2,600 Mt, Amuru with 1,820 Mt, Adjumani with 1,800 Mt and Pallisa with 1,400 Mt in that order. A comparison of districts within regions revealed that Kabale district with 1,200 Mt,; Kiboga with 140 Mt, Amuru District with 2,600 Mt and Pallisa district with 1,400 had greatest outputs in the Western, Central, Northern and Eastern Regions respectively.

The details are provided Table 3.6, Figures 3.11 and 3.12 and Table A3.6 in Annex.

Table 3. 6: Total Area and Total Production of Field Peas, by Region

Region	Second season 2008		First season 2009		Total for 2008/09		Yield (Mt/Ha)

Figure 3. 12: Field Peas Production Trend 1999/00 – 2008/09

3.2.7 Cow Peas

The national production of Cow Peas during the UCA 2008/09 was estimated to be 11,000 Mt from an area of 23,800 Ha.

The highest percentage of this production (6,700 Mt or 60.7%) was realised from Second Season of 2008.

The overall yield of Cow Peas at the national level was 0.5 Mt/Ha. The Western Region had the highest yield of Cow Peas (0.7 Mt/Ha) followed by the Eastern Region (0.5 Mt/Ha) while the Central Region had the lowest (0.2 Mt/Ha).

In terms of regions, the Eastern Region with 7,000 Mt (64.1 %) had the highest percentage of Cow Peas produced during the reference year, followed by the Northern Region with 3,400 Mt (31.0 %) while the Western Region reported the least (280 Mt or 2.4%).

District level figures show that the districts of Soroti , Kumi, Pallisa are the largest producers of Cow Peas in the country with 2,630 Mt 1,121 Mt, 1,110 Mt respectively.

The details are provided Table 3.7, Figures .13.

Table 3. 7: Total Area and Total Production of Cow Peas by region

Region	Second season 2008		First season 2009		Total for 2008/09		Yield (Mt/Ha)
	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	
Central	733	241	402	40	1,135	281	0.2
Eastern	8,720	4,240	4,256	2846	12,976	7,086	0.5
Northern	5,354	2,045	3,998	1384	9,352	3,429	0.4
Western	284	190	70	71	354	261	0.7
UGANDA	15,092	6,716	8,726	4,342	23,818	11,057	0.5

Figure 3. 13: Percentage Distribution of Cow Peas production by region.

3.2.8 Pigeon Peas

The national production of Pigeon Peas during the reference period was estimated to be 11,300 Mt from an area of 29,800 Hectares, with the bigger percentage of this production (6,094 Mt or 53.8%) having been realised from the second season of 2008.

In terms of regions, the Northern Region with 11,000 Mt (97.4%) reported the highest production of Pigeon Peas followed by Eastern Region with 219 Mt (1.9%) while the Central Region reported no production at all.

The Western Region with 0.6 Mt/Ha had the highest yield of Pigeon Peas in the country followed the Northern Region (0.4 Mt/Ha) and then the Eastern Region (0.2Mt/Ha).

The district level figures revealed that Pader (3,700 Mt) reported highest production of Pigeon Peas in the country, followed by Lira (3,200 Mt), while Masindi registered the least production with 3 metric tons. It should be noted that a total of 55 districts did not report production of this crop at all.

The production of the crop within regions indicated that the districts of Pallisa (119 Mt), Pader (3700 Mt), Hoima (52 Mt) had the highest production of Pigeon Peas in the Eastern, Northern and Western Regions respectively.

The details are provided Table 3.8, Figures 3.14 and 3.15 and Table A3.8 in Annex.

Table 3. 8: Total Area and Total Production of Pigeon Peas by region

Region	Second season 2008		First season 2009		Total for 2008/09		Yield (Mt/Ha)
	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	
Central	0		0		0	0	0

3.2.9 Groundnuts

The national production of groundnuts during the period under reference was estimated to be 245,000 Mt from an area of 345,000 Hectares (Ha), with a higher percentage of this production (155,000 Mt or 63.2%) having been realised from the Second Season of 2008.

In terms of regions, the Northern Region with 83,000 Mt (34.0%) reported the highest groundnuts production, followed by Eastern Region with 77,000 Mt (31.6%) while Central Region with 33,000 Mt (13.4%) had the least percentage of the crop produced.

The national yield of groundnuts was estimated to be 0.7 Mt/Ha. This was lower than what was realised in Central (1.2 Mt/Ha) and Western (0.9 Mt/Ha) Regions but higher than the yields realised in the Eastern (0.6Mt/Ha) and Northern (0.6Mt/Ha) Regions.

District level figures revealed that; Soroti district with 19,000 Mt reported the highest production of groundnuts. This was followed by Nakasongola (18,000 Mt), and then Amuru with 15,000 Mt.

Production of groundnuts within regions indicated that the districts of Nakasongola (18,000 Mt), Soroti (19,000 Mt), Amuru (15,000 Mt) and Kibaale (12,000 Mt) reported the biggest production of groundnuts in the Central, Eastern, Northern and Western Regions respectively.

The production of groundnuts registered a downward trend from 135,000 Mt to 126,000 Mt between 1995/96 and 1999/2000 and an upward trend from 126,000 Mt to 245,000 Mt between 1999/2000 and UCA 2008/9.

The details are provided Table 3.9, Figures 3.16 and 3.17 and Table A3.9 in Annex.

Table 3. 9: Total Area and Total Production of Groundnuts by region

Region	Second season 2008		First season 2009		Total for 2008/09		Yield (Mt/Ha)
	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	
Central	13,681	28,449	12,823	4,309	26,504	32,757	1.2
Eastern	41,105	39,015	81,299	38,233	122,404	77,247	0.6

Figure 3. 16: Percentage Distribution of Groundnuts Production by Region.

Figure 3. 17: Groundnuts Production Trend 1995/96 – 2008/9

3.2.10 Simsim

The national production of Simsim during the period under reference was 101,000 Mt from an area of 176,000 Ha, with the biggest percentage of this production (85,000 Mt or 83.7%) realised from the second season of 2008.

Regional distribution indicated that the Northern Region with 94,000 Mt (92.6%) had the highest Simsim production. This was followed by the Eastern Region with 6,800 Mt (6.7%) while the Central Region with a production of 127 Mt (0.1%) had the least percentage.

The Western Region with 0.6 Mt/Ha and the Northern Region (9.6 Mt/Ha) had the highest Simsim yields in the country while the Central Region (0.2 Mt/Ha) reported the smallest yield.

Out of the 80 districts covered in the census, 36 districts (45%) did not report growing the crop. Apac district with (25,000 Mt) produced the biggest quantity of simsim in the country. This was followed by Gulu (12,000 Mt), Kitgum (10,000 Mt) and then Pader with 6,800 Mt.

Production of the crop within regions indicated that the districts of Kayunga (99 Mt), Soroti (3,300 Mt), Apac (25,000 Mt) and Masindi (391 Mt) produced the biggest quantities of simsim in the Central, Eastern, Northern and Western regions respectively.

The details are provided Table 3.10, Figure 3.18 and Table A3.10 in appendix.

Table 3. 10: Total Area and Total Production of Simsim by Region

Region	Second season 2008		First season 2009		Total for 2008/09		Yield (Mt/Ha)
	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	
Central	296	70	294	56	590	127	0.2
Eastern	7,946	3,790	7,370	2,984	15,316	6,774	0.4

Western	612	253	316	312	928	565	0.6
Uganda	132,785	84,547	42,811	16,481	175,596	101,028	0.6

Figure 3. 18: Percentage Distribution of Simsim by Region.

3.2.11 Soya Beans

The national production of Soya Beans during the period under reference was estimated to be 23,000 Mt from an area of 36,000 Ha. There was no big difference in the quantity of production from both the second 2008 and first season 2009.

In terms of regions, the Northern Region with 15,700 Mt (66.6%) reported the highest Soya bean production. This was followed by the Eastern Region with 5,800 Mt (24.6%) while the Central Region with a production of 208Mt (0.9%) had the least percentage production.

The national yield of Soya beans was estimated to be 0.6 Mt/Ha. This was lower than what was realised in the Eastern (0.8 Mt/Ha) and Western (0.9 Mt/Ha) Regions but higher than the yield reported in the Central Region (0.3 Mt/Ha).

Oyam district with 7,841Mt reported the biggest quantity of soya beans in the country. This was followed by Apac (3,100 Mt), Tororo (2,200 Mt) and then Lira with 2,000 Mt Metric tons.

Production of the crop within regions indicated that the districts of Kayunga (119 Mt), Tororo (2,200 Mt), Oyam (7,800 Mt) and Kasese (1,000 Mt) produced the biggest quantities of Soya beans in the Central, Eastern, Northern and Western Regions respectively.

The production of Soya beans registered an upward trend from 5,000 Mt to 24,000 Mt between 1999/2000 and UCA 2008/9.

The details are provided Table 3.11, Figures 3.19 and 3.20 and Table A3.11 in Annex.

Table 3. 11: Total Area and Total Production of Soya Beans by Region

Region	Second season 2008		First season 2009		Total for 2008/09		Yield (Mt/Ha)
	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	
Central	240	33	510	174	750	208	0.3
Eastern	3,723	3,951	3,556	1,850	7,279	5,801	0.8

Western	1,207	1,322	1,013	565.0173	2,220	1,887	0.9
Uganda	16,027	11,784	20,417	11,839	36,444	23,623	0.6

Figure 3. 19: Percentage Distribution of Soya beans production by region.

Figure 3. 20: Production Trend of Soya Beans 1999/00 – 2008/09

3.2.12 Banana (Food type)

The national production of Banana (Food type) during the period under reference was estimated to be 4 million Mt from a total area of 807,000 Ha, with the bigger percentage of this production (2.1 million Mt or 53.1%) realised in the Second season 2008.

In terms of regions, the Western Region reported the highest production of banana (food-type) with a total output of 2.7 million Mt (67.9 %). This was followed by Central Region with 930,000 Mt (23.1%) and the Northern Region with 0.6 percent had the least percentage production.

The Western Region with 6.0 Mt/Ha recorded the highest banana (food) yield, followed by Eastern Region (5.6 Mt/Ha) and the Central Region had the lowest yield of 3.3 Mt/Ha.

Out of the 80 districts covered in the Census, 17 of them did not report growing of the crop. Isingiro district with 597,000 Mt from 45,000 Ha reported the highest production of Banana (food-type). This was followed by Mbarara with a production of 540,000 Mt from 32,000 Ha and then Bushenyi (344,000 Mt from 110,000 Ha). The districts perspective within regions revealed that the Masaka (190,000 Mt), Mbale (99,000 Mt), Arua (15,000 Mt) and Isingiro (597,000 Mt) had the highest banana (food) production in the Central, Eastern, Northern and Western Regions.

Banana (food-type) production showed a decreasing trend from 7,909 Mt to 4,018 Mt between 1995/96 and 2008/09.

The details are provided Table 3.12, Figures 3.21 and 3.22 and Table A3.12 in Annex.

Table 3. 12: Total Area and Total Production of (Food Type) by Region

Region	Second season 2008		First season 2009		Total for 2008/09		Yield (Mt/Ha)
	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)

Uganda	416,719	2,132,393	389,908	1,885,593	806,627	4,017,986	5.0

Figure 3. 21: Percentage Distribution of Production of (Food Type) by Region.

Figure 3. 22: Banana (Food Type) Production Trend 1995/96 – 2008/09

3.2.13 Banana (Beer)

The national production of Banana (Beer) during the period under reference was 243,000 Mt, which came from an estimated area of one 86,000 (Ha). Each of the two seasons of the reference year contributed to about half of the total production realised.

In terms of regions, the Western Region reported the highest production of Banana (Beer) with the total output 138,000 Mt (56.7 %) followed by the Central Region with 99,000 Mt (40.8%) and the least was the Northern Region with 981 Mt (0.4%).

The Northern Region with 4.8 Mt/Ha had highest Banana (Beer) yield, followed by the Western Region with 3.0 Mt/Ha while the Eastern Region reported the least yield (0.8 Mt/Ha).

The production trend of Banana (Beer) showed an increase of 95.6 percent from 535,000 Mt in UNHS 1999/99 to 1.0 million Mt in UNHS 2005/06 and substantially dropped to 243,000 Mt in UCA 2008/09

Out of the 80 districts covered in the census, 49 districts (48.8%) did not report growing of the crop. Kibaale district was the leading producer of Banana (Beer) with a total of 30,000 Mt from an area of 8,000 followed by Mpigi with 24,000 Mt from 6,000 Ha and the third district was Kanungu district with a total of 23,000 Mt from 3,000 Ha and Mubende reported 19,000 Mt from 7,000 Ha. Dokolo and Kampala districts were the least producers of Banana (Beer Type) with 47 Mt and 50 Mt respectively.

The details are provided Table 3.13, Figures 3.23 and 3.24 and Table A3.13 in Appendix.

Table 3. 13: Total Area and Total Production of Banana-beer by Region

Region	Second season 2008		First season 2009		Total for 2008/09		Yield (Mt/Ha)
	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	
Central	19,114	56,893	14,900	42,091	34,014	98,984	2.9
Eastern	2,164	2,361	4,518	2,905	6,682	5,266	0.8
Northern	189	559	15	422	204	981	4.8
Western	25,447	65,551	19,781	72,064	45,228	137,614	3.0
Uganda	46,914	125,364	39,213	117,481	86,127	242,845	2.8

Figure 3. 23: Percentage Distribution of Banana (Beer) Production by Region.

Figure 3. 24: Banana (Beer) Production Trend 1999/2000 – 2008/09

3.2.14 Banana (Sweet Type)

The national production of Banana (Sweet Type) during the period under reference was 37,000 Mt, which came from an estimated area of one 23,000 (Ha) with a higher percentage of this production (20,000 Mt or 55.3%) having been realised from the Second Season of 2008.

In terms of regions, the Western Region reported the highest production of Banana (Sweet Type) with the total output 17,000 Mt (47.8 %) followed by the Central Region with 11,000 Mt (31.0%) and the least was the Eastern Region with 3,117 Mt (8.5%).

The Western Region with 2.3 Mt/Ha had the highest Banana (Sweet Type) yield, followed by the Central Region with 1.3 Mt/Ha while the Eastern Region reported the least yield (1.0 Mt/Ha).

The production trend of Banana (Sweet Type) showed a sharp increase from 46,000 Mt in UNHS 1999/2000 to 131,000 Mt in UNHS 2005/06 and a substantial drop to a low 37,000 Mt in UCA 2008/09.

Out of the 80 districts covered in the census, 26 districts (31.3%) did not report growing of the crop. Rukungiri district was the leading producer of Banana (Sweet Type) with a total of 4,000 Mt from an area of 7,000 Ha followed by Mpigi with 3,000 Mt from 2,000 Ha and the third district was Kabarole district with a total of 2,000 Mt from 1,000 Ha. Mbale and Budaka districts were the least producers of Banana (Sweet Type) with 9 Mt and 10 Mt respectively.

The details are provided Table 3.14, Figures 3.25 and 3.26 and Table A3.14 in Annex.

Table 3. 14: Total Area and Total Production of Banana (Sweet) by Region

Region	Second season 2008		First season 2009		Total for 2008/09		Yield (Mt/Ha)

Figure 3. 26: Production Trend of Banana (Sweet) 1999/00 – 2008/09

3.2.15 Cassava

The national production of Cassava during the period under reference was 2.9 million Mt, which came from an estimated area of one 871,000 (Ha) with a higher percentage of this production (1.7 million Mt or 57.6%) having been realised from the Second Season of 2008.

In terms of regions, the Eastern Region reported the highest production of Cassava with the total output 1.1 Mt (36.7%) followed by the Northern Region with 983,000 Mt (34.0%) and the least was the Central Region with 410,000 Mt (14.2%).

The Northern Region with 3.6 Mt/Ha had the highest Cassava yield, followed by the Western Region with 3.4 Mt/Ha while the Eastern Region with 3.1 Mt reported the least yield.

The production trend of Cassava showed a decrease from 2.7 million Mt in UNHS 1995/96 to 2.2 Mt in UNHS 1999/2000 and a further decrease to 1.7 million Mt in UNHS 2005/06 and thereafter an increase to 2.9 Mt in UCA 2008/09.

Out of the 80 districts covered in the census, only 3 districts (3.8%) did not report growing of the crop. Apac district the leading producer of Cassava with a total of 240,000 Mt from 43,000 Ha followed by Tororo district with 175,000 Mt from an area of 2 7,000 Ha and the third district was Iganga district with 165,000 Mt from 14,000 Ha. Bukwo and Kabale districts were the least producers of Cassava with 89 Mt and 214 Mt respectively.

The details are provided Table 3.15, Figures 3.27 and 3.28 and Table A 3.15 in Annex.

Table 3. 15: Total Area and Total Production of Cassava, by Region

Region	Second season 2008		First season 2009		Total for 2008/09		Yield (Mt/Ha)
	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	
Central	68,247	240,404	59,541	169,408	127,788	409,812	3.2
Eastern	189,214	518,729	153,173	542,457	342,387	1,061,186	3.1
Northern	138,115	673,511	131,771	309,613	269,886	983,124	3.6

Figure 3. 28: Cassava Production Trend 1995/96 – 2008/09

3.2.16 Sweet Potatoes

The national production of Sweet Potatoes during the period under reference was 1.8 million Mt, which came from an estimated area of one 440,000 (Ha) with a higher percentage of this production (1.8 million Mt or 62.4%) having been realised from the Second Season of 2008.

In terms of regions, the Eastern Region reported the highest production of Sweet Potatoes with the total output 847,000 Mt (46.6%) followed by the Western Region with 366,000 Mt (20.1%) and the least was the Central Region with 312,000 Mt (15.2%).

The Eastern Region with 4.8 Mt/Ha had the highest Sweet Potatoes yield, followed by the Northern Region with 4.8 Mt/Ha while the Western Region with 3.0 Mt reported the least yield.

The production trend of Sweet Potatoes showed a decrease from 3.0 million Mt in UNHS 1995/96 to 2.6 Mt in UNHS 1999/2000 and a further decrease to 1.7 million Mt in UNHS 2005/06 and thereafter an increase to 1.8 Mt in UCA 2008/09.

Out of the 80 districts covered in the census, only 1 district (1.3%) did not report growing of the crop. Iganga district was the leading producer of Sweet Potatoes with a total of 311,000 Mt from 22,000 Ha followed by Soroti district with 177,000 Mt from an area of 13,000 Ha and the third district was Kamuli district with 152,000 Mt from 34,000 Ha. Kaabong and Moroto districts were the least producers of Sweet Potatoes with 8 Mt and 63 Mt respectively.

The details are provided Table 3.16, Figures 3.29 and 3.30 and Table A 3.16 in Annex.

Table 3. 16: Total Area and Total Production of Sweet Potatoes by Region

Region	Second season 2008		First season 2009		Total for 2008/09		Yield (Mt/Ha)

Figure 3. 30: Sweet Potatoes Production Trend 1995/96 – 2008/09

3.2.17 Irish Potatoes

The national production of Irish Potatoes during the period under reference was 154,000 Mt, which came from an estimated area of one 33,000 (Ha) with a higher percentage of this production (87,000 million Mt or 56.2%) having been realised from the Second Season of 2008.

In terms of regions, the Western Region reported the highest production of Irish Potatoes with the total output of 135,000 Mt (87.6%) followed by the Central Region with 13,000 Mt (8.6%) and the least was the Northern Region with 1,000 Mt (0.8%).

The western Region with 5.2 Mt/Ha had the highest Irish Potatoes yield, followed by the Eastern Region with 3.6 Mt/Ha while the Northern Region with 2.2 Mt reported the least yield.

Out of the 80 districts covered in the census, 39 districts (48.8%) did not report growing of the crop. Kisoro district was the leading producer of Irish Potatoes with a total of **138,000** Mt from **3,000** Ha followed by Isingiro district with **111,000** Mt from an area of **2,000** Ha and the third district was Kabale district with **61,000** Mt from **9,000** Ha. Nakaseke and Lira districts were the least producers of Irish Potatoes with **48** Mt and **53** Mt respectively.

The details are provided Table 3.17, Figures 3.31 and 3.32 and Table A 3.17 in Annex.

Table 3. 17: Total Area and Total Production of Irish Potatoes by Region

Region	Second season 2008		First season 2009		Total for 2008/09		Yield (Mt/Ha)
	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)

3.2.18 Arabica (Old)

The national production of Arabica (Old) during the period under reference was 89,000 Mt, which came from an estimated average area of 62,000 Ha. Out of these, 62,200 MT (70.2%) was produced in the Second Season 2008 while 26,400 MT (29.8%) was produced in the First Season 2009.

In terms of regions, the Eastern Region reported the highest production of Arabica (Old) with the total output of 54,800 Mt (61.9 %) followed by the Western Region with 32.1 percent and the least was the Northern Region with 2.2 percent.

The national yield was estimated to be 1.4 MT/Ha. The Eastern Region with 3.4 Mt/Ha had the highest Arabica (Old) yield, followed by the Western Region with 1.0 Mt/Ha while the Central Region reported the least yield (0.2 Mt/Ha).

The details are provided in Table 3.18 and Figure 3.33.

Table 3. 18: Total Area and Total production of Arabica (Old) by Region

Region	Second season 2008		First season 2009		Total for 2008/09		
	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	Average Area (Ha)	Production (Mt)	Yield (Mt/Ha)
Central	14,778	1,913	15,540	1,477	15,159	3,390	0.2

Uganda	65,111	62,229	59,357	26,403	62,234	88,632	1.4

Figure 3. 33: Percentage Distribution of production of Arabica (Old) by region

3.2.19 Robusta (Old)

The national production of Robusta (Old) during the period under reference was 156,000 Mt, which came from an estimated average area of 110,500 Ha. Out of these, 120,000 MT (76.8%) was produced in the Second Season 2008 while 36,000 MT (23.2%) was produced in the First Season 2009.

In terms of regions, the Central Region reported the highest production of Robusta (Old) with the total output of 81,000 Mt (52.1%) followed by the Western Region with 32.9 percent while the Northern Region reported the least (0.1%).

The national yield was estimated to be 1.4 MT/Ha. The Western Region with 2.7 Mt/Ha had the highest Robusta (Old) yield, followed by the Central Region with 1.3 Mt/Ha while the Northern Region reported the least yield (0.3 Mt/Ha).

The details are provided in Table 3.19 and Figure 3.34

Table 3. 19: Total Area and Total production of Robusta (Old) by region

Region	Second season 2008		First season 2009		Total for 2008/09		Yield (Mt/Ha)
	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	Average Area (Ha)	Production (Mt)

Figure 3. 34: Percentage Distribution of production of Robusta (Old) by region

3.2.20 Arabica (New)

The national production of Arabica (New) during the period under reference was 8,400 Mt, which came from an estimated average area of 4,600 Ha. Out of these, 7,000 MT (83.5%) was produced in the Second Season 2008 while 1,400 MT (16.5%) produced in the First Season 2009.

In terms of regions, the Western Region reported the highest production of Arabica (New) with the total output of 6,700 Mt (79.4 %) followed by the Eastern Region with 11.8 percent and the least was the Northern Region with 2.3 percent.

The national yield was estimated to be 1.8 MT/Ha. The Western Region with 2.1 Mt/Ha had the highest Arabica (New) yield, followed by the Eastern Region with 2.0 Mt/Ha while both the Central and Northern Regions reported the least yield (0.8 Mt/Ha).

The details are provided in Table 3.20 and Figure 3.35

Table 3. 19: Total Area and Total Production of Arabica (New) by Region

Region	Second season 2008		First season 2009		Total for 2008/09		Yield (Mt/Ha)
	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	Average Area (Ha)	Production (Mt)

Uganda	5,057	7,016	4,112	1,382	4,584	8,397	1.8

Figure 3. 35: Percentage Distribution of production of Arabica (New) by Region

3.2.21 Robusta Clonal

The national production of Robusta Clonal during the period under reference was 33,000 Mt, which came from an estimated average area of 18,000 Ha. Out of these, 29,000 MT (87.0%) was produced in the Second Season 2008 while 4,300 MT (13.0%) was produced in the First Season 2009.

In terms of regions, the Eastern Region reported the highest production of Robusta Clonal with the total output of 25,500 Mt (77.2%) followed by the Western Region with 21.1 percent while the Northern Region reported no production.

The national yield was estimated to be 1.8 MT/Ha. The Western Region with 2.7 Mt/Ha had the highest Robusta Clonal yield, followed by the Central Region with 1.7 Mt/Ha while the Eastern Region reported the least yield (1.0 Mt/Ha).

The details are provided in Table 3.21 and Figure 3.36

Table 3. 20: Total Area and Total Production of Robusta Clonal by Region

Region	Second season 2008		First season 2009		Total for 2008/09		Yield (Mt/Ha)
	Area (Ha)	Production (Mt)	Area (Ha)	Production (Mt)	Average Area (Ha)	Production (Mt)

Figure 3. 36: Percentage Distribution of Production of Robusta Clonal by Region

3.3 Crop Disposition

3.3.2 Maize

Out of the 2.4 million Metric tones (Mt) of maize produced during the reference period, the crop disposition was as follows: sold, 957,000 (40.5%); consumed, 810,722 (34.3%); stored, 456,912 (19.3%); and used for other purposes, 83,432 (3.5%).

In terms of regions, the Central Region had the highest percentage (57.1%) of its production having been sold followed by the Western Region with 45.3 percent while the Northern Region had the least (26.7%). As far as consumption was concerned, the Northern Region had the highest percentage (44.3%) followed by the Eastern Region with (35.4%) while the Central Region had the least (26.8%). In the case of the quantity in store, the Eastern Region had the highest Percentage (23.1%) closely followed by the Northern Region with 22.5 percent while the Central Region recorded the least (11.9%). Regarding the Maize used for other purposes, there was no significant difference between the regions as the Western Region with 3.0 percent recorded the lowest while the Eastern Region with 3.7 percent had the highest.

The details are provided in Tables 3.22 (a) and 3.22 (b) and Figure 3.37

Table 3. 21(a) Maize production (Mt) and its disposition (Mt) by type and region

Region	Production (Mt)	Disposition (Mt) type:			
		Sold	Consumed	Stored	Used for other purposes
Central	449,859	256,782	120,407	53,509	16,184
Eastern	1,108,554	393,039	392,930	255,651	41,321
Northern	305,798	81,744	135,601	68,741	10,816

Northern	26.7	44.3	22.5	3.5
Western	45.3	32.5	15.9	3.0
Uganda	40.5	34.3	19.3	3.5

Figure 3. 37: Distribution of Maize production and its disposition (Mt) by type and region

3.3.3 Finger Millet

Out of the 277,000 Metric tones (Mt) of Finger Millet produced during the reference period, the crop disposition was as follows: sold, 53,000 (19.0%); consumed, 104,000 (37.7%); stored, 93,000 (33.5%); and used for other purposes, 27,000 (9.8%).

In terms of regions, the Central Region had the highest percentage (39.5%) of its production having been sold followed by the Western Region with 20.3 percent while the Northern Region had the least (13.5%). As far as consumption was concerned, the Northern Region had the highest percentage (45.5%) followed by the Eastern Region with (36.6%) while the Central Region had the least (22.8%). In the case of the quantity stored, the Western Region had the highest Percentage (37.2%) closely followed by the Eastern Region with 36.2 percent while the Central Region recorded the least (13.6%). It is worth noting that the Central Region with 23.1 percent of its production had a larger percentage of its millet being used for other purposes in comparison with what was consumed or stored.

The details are provided in Tables 3.23 (a) and 3.23 (b) and Figure 3.38

Table 3.22(a): Finger Millet production (Mt) and its disposition (Mt) by type and region

Region	Production (Mt)	Disposition			
		Sold	Consumed	Stored	Used for other purposes
Central	13,734	5,432	3,126	1,873	3,174
Eastern	106,838	20,689	39,123	38,728	8,286

Uganda	19.0	37.7	33.5	9.8

Figure 3. 38: Distribution of Finger Millet production and its disposition (Mt) by type and region

3.3.4 Sorghum

Out of the 376,000 Metric tones (Mt) of Sorghum produced during the reference period, the crop disposition was as follows: sold 54,000 (14.3%); consumed, 176,000 (46.9%); stored, 113,000 (30.1%); and used for other purposes, 32,000 (8.6%).

In terms of regions, the Central Region had the highest percentage (64.1%) of its production having been sold followed by the Western Region with 24.5 percent while the Northern Region had the least (11.4%). As far as consumption was concerned, the Eastern Region had the highest percentage (51.8%) followed closely by the Northern Region with (50.5%) while the Central Region had the least (10.5%). In the case of the quantity stored, the Western Region had the highest Percentage (39.9%) followed by the Eastern Region with 28.5 percent while the Central Region recorded the least (12.0%).

The details are provided in Tables 3.24 (a), 3.24 (b) and Figure 3.39

Table 3.23(a): Sorghum production (Mt) and its disposition (Mt) by type and region

Region	Production (Mt)	Disposition			
		Sold	Consumed	Stored	Used for other purposes
Central	2,678	1,716	282	322	82

Uganda	14.3	46.9	30.1	8.6

Figure 3. 39: Distribution of Sorghum production and its disposition (Mt) by type and region

3.3.5 Rice

Out of the 191,000 Metric tones (Mt) of maize produced during the reference period, the crop disposition was as follows: sold, 104,000 (54.5%); consumed, 46,000 (24.1%); stored, 24,000 (12.4%); and used for other purposes, 16,000 (8.3%).

In terms of regions, the Central Region had the highest percentage (68.2%) of its production having been sold closely followed by the Western Region with 67.5 percent while the Northern Region had the least (35.4%). As far as consumption was concerned, the Eastern Region had the highest percentage (25.9%) followed by the Northern Region with (22.4%) while the Central Region had the least (14.9%). In the case of the quantity stored, the Northern Region had the highest Percentage (21.2%) followed by the Western Region with 9.9 percent while the Central Region recorded the least (4%). It is worth noting that the Northern Region had a substantial percentage (18.8%) of its production that had been used for other purposes.

The details are provided in Tables 3.25 (a), 3.25 (b) and Figure 3.40

Table 3. 24(a): Rice production (Mt) and its disposition (Mt) by type and region

3.3.8 Cow Peas

Out of the 11,000 Metric tones (Mt) of Cow Peas produced during the reference period, the crop disposition was as follows: *sold*, 2,300 (20.7%); *consumed*, 5,700 (51.5%); *stored*, 2,000 (18.5%); and *used for other purposes*, 520 (4.7%).

In terms of regions, the Central Region had the highest percentage (78.0%) of its production having been sold followed by the Eastern Region with 22.4 percent while the Northern Region had the least (12.7%). As far as consumption was concerned, the Northern Region had the highest percentage (58.1%) followed by the Eastern Region with (50.1%) while the Central Region had the least (20.0%). In the case of the quantity stored, the Northern Region had the highest Percentage (19.4%) followed by the Eastern Region with 18.8 percent while the Central Region recorded the least (1.9%).

The details are provided in Tables 3.28 (a), 3.28 (b) and Figure 3.43

Figure 3. 43: Distribution of Cow Peas production and its disposition (Mt) by type and region

3.3.9 Pigeon Peas

Out of the 11,000 Metric tones (Mt) of maize produced during the reference period, the crop disposition was as follows: *sold*, 675 (6.0%); *consumed*, 5,900 (52.2%); *stored*, 3,900 (34.4%); and *used for other purposes*, 800 (7.0%).

In terms of regions, the Eastern Region had the highest percentage (64.1%) of its production having been sold followed by the Northern Region with 4.8 percent while both the Central and Western Regions reported no sales. As far as consumption was concerned, the Western Region had the highest percentage (54.3%) closely followed by the Northern Region with (52.9%) while the Central Region recorded nothing. In the case of the quantity stored, the Northern Region had the highest Percentage (35.0%) followed by the Eastern Region with 11.7 percent while the Central Region recorded nothing. It is however, worth noting that 11,000 out of 11,300 Mt i.e. percent of the Pigeon Peas are produced in the Northern Region.

The details are provided in Tables 3.29 (a), 3.29 (b) and Figure 3.44

Table 3. 28 (a): Pigeon Peas production (Mt) and its disposition (Mt) by type and region

Region	Production (Mt)	Disposition			
		Sold	Consumed	Stored	Used for other purposes
Central	0	0	0	0	0
Eastern	219	141	33	26	7
Northern	11,031	535	5,835	3,861	779
Western	80	0	44	6	6
Uganda	11,330	675	5,912	3,892	792

Western	0.0	54.8	7.3	7.2
Uganda	6.0	52.2	34.4	7.0

Figure 3. 44: Distribution of Pigeon Peas production and its disposition (Mt) by type and region

3.3.10 Groundnuts

Out of the 245,000 Metric tones (Mt) of maize produced during the reference period, the crop disposition was as follows: *sold*, 77,000 (31.7%); *consumed*, 79,000 (32.2%); *stored*, 59,000 (24.0%); and *used for other purposes*, 30,000 (12.1%).

In terms of regions, the Western Region had the highest percentage (37.8%) of its production having been sold followed by the Eastern Region with 37.4 percent while the Northern Region had the least (23.8%). As far as consumption was concerned, the Northern Region had the highest percentage (37.2%) followed by the Central Region with (35.7%) while the Eastern Region had the least (24.5%). In the case of the quantity stored, the Eastern Region had the highest Percentage (28.9%) closely followed by the Northern Region with 25.5 percent while the Western Region recorded the least (16.9%).

The details are provided in Tables 3.30 (a), 3.30(b) and Figure 3.45

Table 3. 29 (a): Groundnuts production (Mt) and its disposition (Mt) by type and region

Region	Production (Mt)	Disposition			
		Sold	Consumed	Stored	Used for other purposes
Central	32,757	9,342	11,678	6,478	5,259

3.3.11 Simsim

Out of the 101,000 Metric tones (Mt) of Simsim produced during the reference period, the crop disposition was as follows: sold, 33,574 (33.2%); consumed, 37,354 (37.0%); stored, 23,845 (23.6%); and used for other purposes, 6,065 (6.0%).

In terms of regions, the Northern Region had the highest percentage (33.7%) of its production having been sold closely followed by the Eastern Region with 27.9 percent while the Central Region had the least (10.2%). As far as consumption was concerned, the Central Region had the highest percentage (45.7%) followed by the Western Region with (43.2%) while the Eastern Region had the least (34.1%). In the case of the quantity stored, the Eastern Region had the highest percentage (27.4%) closely followed by the Northern Region with 23.4 percent while the Central Region recorded the least (18.9%). Regarding the Simsim used for other purposes, the Western Region had the highest percentage (10.4%) followed by the Central Region with 9.4 percent while the Northern Region reported the least percentage (5.8%).

The details are provided in Tables 3.31 (a) and 3.31 (b) and Figure 3.46

Table 3. 30(a): Simsim production (Mt) and its disposition (Mt) by type and region

Region	Production (Mt)	Disposition (Mt) type:			
		Sold	Consumed	Stored	Used for other purposes

3.3.12 Soya Beans

Out of the 23,000 Metric tones (Mt) of Soya Beans produced during the reference period, the crop disposition was as follows: sold, 14,886 (64.3%); consumed, 3,594 (15.5%); stored, 3,216 (13.9%); and used for other purposes, 1,626 (7.0%).

In terms of regions, the Northern Region had the highest percentage (71.1%) of its production having been sold followed by the Western Region with 62.3 percent while the Central Region had the least (26.4%). As far as consumption was concerned, the Eastern Region had the highest percentage (28.1%) followed by the Western Region with (19.6%) while the Northern Region had the least (10.3%). In the case of the quantity stored, the Central Region had the highest percentage (30.3%) followed by the Eastern Region with 16.1 percent while the Western Region recorded the least (4.5%). Regarding the Soya Beans used for other purposes, the Western Region had the highest percentage (9.9%) followed by the Eastern Region with 8.0 percent while the Eastern Region reported the least percentage (3.3%).

The details are provided in Tables 3.32 (a) and 3.32 (b) and Figure 3.47

Table 3. 315(a): Soya Beans production (Mt) and its disposition (Mt) by type and region

Region	Production (Mt)	Disposition (Mt) type:			
		Sold	Consumed	Stored	Used for other purposes
Central	208	55	33	63	7
Eastern	5,743	2,763	1,611	926	462

3.3.13 Banana (Food)

Out of the 4.0 million Metric tones (Mt) of Banana (Food) produced during the reference period, the crop disposition was as follows: sold, 1.4 million (34.6%); consumed, 2.4 million (59.8%); stored, 24,755 (0.6%); and used for other purposes, 200,164 (5.0%).

In terms of regions, the Northern Region had the highest percentage (49.1%) of its production having been sold followed by the Western Region with 36.4 percent while the Central Region had the least (28.8%). As far as consumption was concerned, the Central Region had the highest percentage (66.3%) followed by the Western Region with (59.2%) while the Northern Region had the least (41.5%). In the case of the quantity stored, the Eastern Region had the highest percentage (5.6%) followed by the Central and Western Region each with 0.2 percent while the Northern Region recorded the least (0.1%). Regarding the Banana (Food) used for other purposes, the Eastern Region had the highest percentage (12.8%) followed by the Northern Region with 8.5 percent while the Western Region reported the least percentage (4.1%).

The details are provided in Tables 3.33 (a) and 3.33 (b) and Figure 3.48

Table 3. 32(a): Banana (Food) production (Mt) and its disposition (Mt) by type and region

Region	Production (Mt)	Disposition (Mt) type:			
		Sold	Consumed	Stored	Used for other purposes

Figure 3. 48: Distribution of Banana (Food) national production and its disposition (Mt) by type and region

3.3.14 Banana (Beer)

Out of the 243,000 Metric tones (Mt) of Banana (Beer) produced during the reference period, the crop disposition was as follows: *sold*, 188,925 (77.8%); *consumed*, 27,697 (11.4%); *stored*, 129 (0.1%); and *used for other purposes*, 25,512 (10.5%).

In terms of the within region analysis, the Central Region had the highest percentage (87.4%) of its production having been sold followed by the Western Region with 72.0 percent while the Northern Region had the least (10.3%). As far as consumption was concerned, the Northern Region had the highest percentage (52.6%) followed by the eastern Region with (36.8%) while the western Region had the least (10.5%). In the case of the quantity *stored*, only the Western Region reported 0.1 percent of the Banana (Beer) having been stored. Regarding the Banana (Beer) *used for other purposes*, the Western Region had the highest percentage (17.1%) followed by the Northern Region with 13.7 percent while the Eastern Region reported the least percentage (1.5%).

The details are provided in Tables 3.34 (a) and 3.34 (b) and Figure 3.49

Table 3. 33(a): Banana (Beer) production (Mt) and its disposition (Mt) by type and region

Region	Production (Mt)	Disposition (Mt) type:			
		Sold	Consumed	Stored	Used for other purposes

3.3.15 Banana (Sweet)

Out of the nearly 37,000 Metric tones (Mt) of Banana (Sweet) produced during the reference period, the crop disposition was as follows: *sold*, 20,131 (55.3%); *consumed*, 14,426 (39.5%); *stored*, 45 (0.1%); and *used for other purposes*, 1,617 (4.4%).

In terms of the within region analysis, the Western Region had the highest percentage (58.0%) of its production having been sold closely followed by the Central Region with 56.3 percent while the Eastern Region had the least (47.2%). As far as consumption was concerned, the Eastern Region had the highest percentage (46.5%) followed by the northern Region with 41.0 percent while the Western Region had the least (37.2%). In the case of the quantity *stored*, the Eastern Region had the highest percentage (0.5%) followed by the Western Region with 0.2 percent while both the Northern and Central Region each recorded the least (0.0%). Regarding the Banana (Sweet) *used for other purposes*, the Northern Region had the highest percentage (9.9%) followed by the Western Region with 4.3 percent while the Eastern Region reported the least percentage (1.7%).

The details are provided in Tables 3.35 (a) and 3.35 (b) and Figure 3.50

Table 3. 34(a): Banana (Sweet) production (Mt) and its disposition (Mt) by type and region

Region	Production (Mt)	Disposition (Mt) type:			
		Sold	Consumed	Stored	Used for other purposes

3.3.16 Cassava

Out of the 2.9 million Metric tones (Mt) of Cassava produced during the reference period, the crop disposition was as follows: *sold*, 643,622 (22.2%); *consumed*, 1.8 million (60.9%); *stored*, 283,025 (9.8%); and *used for other purposes*, 205,583 (7.1%).

In terms of the within region analysis, the Central Region had the highest percentage (29.9%) of its production having been sold followed by the Western Region with 26.9 percent while the Eastern Region had the least (17.5%). As far as consumption was concerned, there was no significant difference in percent given that the Central Region had the highest percentage (62.0%) while the Northern recorded the lowest percentage (60.3). In the case of the quantity *stored*, the Eastern Region had the highest Percentage (14.1%) followed by the Northern Region with 10.1 percent while the Central Region recorded the least (2.2%). Regarding the Cassava *used for other purposes*, each of the Eastern and Northern Regions had the highest percentage (7.5%) followed by the Western Region with 6.6 percent while the Central Region reported the least percentage (5.7%).

The details are provided in Tables 3.36 (a) and 3.36 (b) and Figure 3.51

Table 3. 35(a): Cassava production (Mt) and its disposition (Mt) by type and region

Region	Production (Mt)	Disposition (Mt) type:			
		Sold	Consumed	Stored	Used for other purposes
Central	409,812	122,485	253,959	9,108	23,494

3.3.17 Sweet Potatoes

Out of the 1.8 million Metric tones (Mt) of Sweet Potatoes produced during the reference period, the crop disposition was as follows: *sold*, 220,709 (12.1%); *consumed*, 1.4 million (76.0%); *stored*, 83,292 (4.6%); and *used for other purposes*, 130,223 (7.2%).

In terms of the within region analysis, the Central Region had the highest percentage (18.9%) of its production having been sold closely followed by the western Region with 16.6 percent while the Eastern Region had the least (7.7%). As far as consumption was concerned, the Eastern Region had the highest percentage (79.2%) followed by the Western Region with 76.8%) while the Central Region had the least (70.3.1%). In the case of the quantity *stored*, the Eastern Region had the highest percentage (7.7%) followed by the Northern Region with 3.5 percent while the Central Region recorded the least (1.7%). Regarding the Sweet Potatoes *used for other purposes*, the Western Region had the highest percentage (9.7%) followed by the Central Region with 8.8 percent while the Eastern Region reported the least percentage (5.4%).

The details are provided in Tables 3.37 (a) and 3.37 (b) and Figure 3.52

3.3.18 Irish Potatoes

Out of the 154,000 Metric tones (Mt) of Irish Potatoes produced during the reference period, the crop disposition was as follows: *sold*, 62,412 (40.5%); *consumed*, 60,373 (39.1%); *stored*, 10,502 (6.8%); and *used for other purposes*, 19,874 (12.9%).

In terms of the within region analysis, the Northern Region had the highest percentage (67.2%) of its production having been *sold* followed by the Central Region with 48.0 percent while the Eastern Region had the least (39.6%). As far as consumption was concerned, the Eastern Region had the highest percentage (44.2%) closely followed by the Central Region with 41.4% percent while the Northern Region had the least (17.1%). In the case of the quantity *stored*, the Western Region had the highest percentage (7.5%) followed by the Eastern Region with 2.1 percent while the Northern did not record anything significant. Regarding the Irish Potatoes *used for other purposes*, the Northern Region had the highest percentage (15.0%) followed by the Western Region with 13.4 percent while the Central Region reported the least percentage (8.4%).

The details are provided in Tables 3.38 (a) and 3.38 (b) and Figure 3.53

Table 3. 37(a): Irish Potatoes production (Mt) and its disposition (Mt) by type and region

Annex 1: Glossary of UCA 2008/09 Terms

Census: statistical collection involving the enumeration of all units (large sample-based collections are sometimes also referred to censuses).

Agricultural Census: collection of structural data from agricultural holdings

Agricultural Extension Services: refers to the provision of agricultural advice and information to crop and livestock producers etc. Extension services may be provided by Government Institutions, non-government organisations, farmer organisations, educational institutions, informal grass-roots organisations, and others.

Agricultural Equipment: refers to machinery, implements and other facilities used on the holding solely or partly for agricultural production during reference period.

Agricultural holding: is an economic unit of agriculture production under single management comprising of all livestock kept and all land used wholly or partly for agriculture purposes without regard to title, legal form or size.

Agricultural Holder: is a person who exercises management control over the holding and takes major decisions regarding resource use.

Agricultural Household: a household whose largest source of income consists of income derived from agricultural production.

Agricultural Land: This is the sum of arable land, land under permanent crops and land under permanent pastures.

Agricultural Season: The main/first agricultural season normally refers to the growing cycle of temporary crops that are planted and harvested in the first half of the year, occasionally extending up to the end of June.

Agro-forestry: farm management system involving growing trees in conjunction with crops and livestock production.

Aquaculture: farming of aquatic organisms including fish, crustaceans, molluscs, and aquatic plants.

Arable land: land used in most years for growing temporary crops, left temporary fallow or used as temporary pastures.

Associated crops: temporary crops growing together on the same piece of land with permanent crops in compact plantation.

Current agricultural statistics: ongoing agricultural statistics on such things as production and prices, as opposed to structural data collected in the agricultural census.

Customary tenure: Is a traditional method of owning land. Each community has traditionally developed a system of owning land. It may be owned either by the community, clan families or individuals. Individuals can have ownership rights to land either of the above mentioned tenure systems. Person who owns land under these systems, except customary tenure, is entitled to possess a certificate of title. But a certificate of customary ownership is given is given to a person or a group of persons who owned land under customary system. A detailed discussion and definitions of the different forms of certificates is provided in the section that deals with land rights, certificates and disputes. Land owned under these arrangements should be recorded in part A.

Drainage: removal of excess water to improve agricultural productivity.

Economic activity status: a classification describing a person as employed, unemployed or not economically active.

Economically active: a person who is either employed or unemployed.

Economic Production Activities: Other economic production activities are economic production activities undertaken by the household enterprise, other than agricultural production on the holding. This may include fishing, collecting forestry products, craft activities, and operating a family business. It does not include paid work as an employee.

Educational attainment: highest level of education achieved by a person.

Employed: a person with paid work or in self-employment.

Employee: a person in paid employment.

Enumeration area (EA): small geographic unit defined for census enumeration purposes.

Establishment: an economic unit operating in a single location, mainly engaged in a single productive activity.

Enterprise: an economic unit under single management consisting of one or more than one establishment.

Exotic: Refers to livestock introduced in the country from abroad e.g. Holstein Friesian, jersey and Guernsey.

Extension workers: These are individuals employed by the government or non-governmental organisations who work as an agricultural development agents for contacting and demonstrating improved farming methods to farmers. They are responsible for organising, disseminating, guiding and introducing technical methods in agricultural production directly to farmers and for facilitating farmers coming into contact with cultivation methods to promote agricultural production.

Farm management: refers to the operation and organisation of the farm. In other words it refers to what farmers do to manipulate resources and situation to achieve their goals.

Fertilizers: substances that supply plants with nutrients or enhance plant growth, containing at least 5% of the three primary nutrients.

Forest: land with trees of height 5 metres or more with crown cover of more than 10%.

Frame: the basis used for identifying all the statistical units to be enumerated in a statistical collection.

Hired labour: Is labour input supplied by other persons other than the holding members and who are paid for their work either in cash or kind or both. The persons are hired for doing agricultural work on the holding; they can be permanent or temporary.

Household: group of people living together, making common arrangements for food and other essentials of living.

Household food security: the situation where all members of a household at all times are consuming enough safe and nutritious food.

Improved/cross: refers to livestock which are crosses of exotic and indigenous breed.

Indigenous cattle: refers to livestock of local types e.g. the Ankole long horned cattle, Zebu, Nganda type of cattle.

Irrigation: purposely providing land with water, other than rain, for agricultural purposes.

Item: a particular characteristic being measured in the agricultural census.

Land dispute: Is a disagreement over land rights, boundaries or users, a land dispute occurs where the specific individuals or collective interests relating to land are in conflict.

Landless holding: agricultural holding with no land.

Land temporarily fallow: is land left to rest for a period less than five years before it is cultivated again.

Land tenure: arrangements under which a holder operates land on a holding.

Land under permanent crops: This is land which is cultivated with crops which occupy it for a year or longer and which do not have to be planted after harvest. Land under tree crops is included in this broad category, except land under forest trees which should be classified under "wood or forest land". Permanent pastures are excluded.

Land under temporary crops: includes all land used for crops with a growing cycle of under one year, sometimes only a few months, which needs to be newly sown or planted for further production after the harvest.

Land under temporary pastures: is the land temporarily cultivated with pastures.

Land under permanent pastures: means land used permanently (i.e. for five years or more), seeded and cared for or grown naturally (grazing land). Permanent pastures on which trees and shrubs are grown should be classified under this category only if the growing of grass (naturally growing grass) is the most important use of the area.

Land use: classification of land according to the activity undertaken on the land.

Legal status of holder: juridical aspects under which an agricultural holding is operated.

Livestock: animals (including birds and insects) kept or reared in captivity mainly for agricultural purposes.

Livestock census: enumeration of livestock holdings undertaken in some countries separately from the agricultural census.

Mixed cropping: several temporary crops grown simultaneously as a mixture on the same piece of land.

Mixed stand: This describes different crops simultaneously grown on the same plot.

Module: a separate component of the agricultural census – a modular approach is used for the agricultural census, with core and supplementary modules.

Occupation: a classification of the type of work done by a person – not to be confused with the industry in which a person works.

Organic fertilizers: fertilizers prepared from processed plant and animal material

Other wooded land: land with tree/shrub/bush cover less than that required to be classified as a forest.

Own-account agricultural production: a household characteristic, indicating that the household contains one or more agricultural holdings.

Parcel: piece of land of one tenure type entirely surrounded by other land not operated by the holding or by other parcels of the holding under a different tenure type.

Permanent Crop: long-term crops that do not have to be re-planted for several years.

Pesticide: substances intended to repel, mitigate, control or destroy diseases and pests in plants or animals and to prevent any harm to agricultural commodity during production, storage, transport, processing and marketing etc.

Plot: A plot is defined as a piece of land within the holding on which a specific crop or a crop mixture is grown. A parcel may be made up of one or more plots.

Population census: the collection of demographic and socio-economic data for all persons in a country, normally undertaken every ten years.

Pure stand: This is a crop cultivated in a crop plot. A pure stand can either be permanent or temporary.

Random sampling: sampling method used for sample surveys, in which each unit within the scope of the survey has a fixed, but not necessarily the same, probability of selection in the sample.

Reference period: the time period to which a given data item collected in a census or survey refers – for example, an agricultural year for crops; the day of enumeration for livestock.

Sampling frame: the means by which all in-scope units are identified for a sample survey.

Sector: the institutional category (such as household, corporation, cooperative, government) to which the holding belongs.

Shifting cultivation: cultivation whereby land is cultivated for some years before being abandoned.

Soil degradation: decline in soil quality caused by natural processes or improper use by humans.

Status in employment: the classification of a job held by a person according to whether it is as an employee, own-account worker, etc.

Successive crops: two or more temporary crops grown successively on the same piece of land at different times during the year.

Temporary crops: crops with a less than one-year growing cycle.

Wood or Forest land: includes wood lots or tracts of timber, natural or planted, which have or will have value as wood, timber or other forest products. Nurseries of forest trees should also be classified under this category. Wood or forest land used only for recreational purposes should be classified as “All other land”

Name of National Supervisor:

National Supervisor's signature:

Section 4.2 Area Characteristics

18. Does the holder operate agricultural land located within the Enumeration Area

Yes 1

No 2

If No, end interview

(Circle the appropriate response)

19. Has the holding grown crops in this agricultural season?

Yes 1

No 2

If No, end interview

(Circle the appropriate response)

20. Specify for each crop type grown in the current agricultural season, the total number of plots and the distribution of plots on pure and mixed stands. Ask the respondent the name of crops and number of plots and add the appropriate crop code from the annex).

Serial Number	Crop Name	Crop Code	Number of plots	
			Pure	Mixed
(1)	(2)	(3)	(4)	(5)
01				
02				
03				
04				
05				
06				
07				
08				
09				
10				
11				
12				
13				
14				
15				

Codes for col. 3 are in Annex 1 on Page 5

21. Specify all agricultural land by parcel (incl. Land for farmhouse, stables, storehouses, etc.) used by the holder **within** the actual Enumeration Area and elsewhere.
 Start with the parcels within the Enumeration Area and list possible parcels located **elsewhere** at the end as follows:
(circle the correct response, where applicable).

Parcel no.	Parcel name	Sex of the person responsible for the parcel (3)	Location of the parcel (code) (Circle the correct response) (4)					Ownership (Circle the correct response) (5)						Presence of shifting cultivation (6)	Period (in years) since cleared (7)	Area in hectares using GPS device (Only for parcels within EA) (8)			Holder's area estimate (for parcels outside the EA) (10)					
			Within EA					Outside EA								Measuring unit	Hectare ...			Area
